D. Upon initial installation, all wiring outlets, junction, pull and outlet boxes shall have dust covers installed. Dust covers shall not be removed until wiring installation when permanent dust covers or devices are installed.

E. "Fire alarm system" decal or silk-screened label shall be applied to all junction box covers.

3.04 CONDUCTORS

A. Each conductor shall be identified as shown on the drawings at each termination with wire markers at terminal points. Attach permanent wire markers within 2in (50mm) of the wire termination. Marker legends shall be visible.

B. All wiring shall be supplied and installed in compliance with the requirements of the National Electric Code, NFPA 70, Article 760, and that of the manufacturer.

C. Wiring for strobe and audible circuits shall be a minimum 14 AWG; signal line circuits minimum 18 AWG twisted.

D. All splices shall be made using solder-less connectors. All connectors shall be installed in conformance with the manufacturer's recommendations.

E. Crimp-on type spade lugs shall be used for terminations of stranded conductors to binder screw or stud type terminals. Spade lugs shall have upset legs and insulation sleeves sized for the conductors.

F. The installation contractor shall submit for approval, prior to installation of wire, a proposed color code for system conductors to allow rapid identification of circuit types.

G. Wiring within sub panels shall be arranged and routed to allow accessibility to equipment for adjustment and maintenance.

3.05 DEVICES

A. Relays and other devices to be mounted in auxiliary panels are to be securely fastened to avoid false indications and failures due to shock or vibration.

B. Wiring within panels shall be arranged and routed to allow accessibility to equipment for adjustment and maintenance.

C. All devices and appliances shall be mounted to or in an approved electrical box.

3.06 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 16100, "Basic Electrical Materials and Methods."

B. Permanently label or mark each conductor at both ends with permanent alphanumeric wire markers.

C. A consistent color code for fire alarm system conductors shall be maintained throughout the installation.

3.07 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Testing General:

1. All alarm initiating devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.
2. Wiring runs shall be tested for continuity, short circuits and grounds before the system is energized. Resistance, current and voltage readings shall be made as work progresses.
3. The acceptance inspector shall be notified before the start of the required tests. All items found at variance with the drawings or this specification during testing or inspection by the acceptance inspector shall be corrected.
4. Test reports shall be delivered to the acceptance inspector as completed.
5. All test equipment, instruments, tools and labor required to conduct the system tests shall be made available by the installing contractor. The following equipment shall be a minimum for conducting the tests:
    a. Ladders and scaffolds as required to access all installed equipment.
    b. Multi-meter for reading voltage, current and resistance.
    c. Two-way radios and flashlights.
    d. A manufacturer recommended device for measuring air flow through air duct smoke detector sampling assemblies.
    e. Decibel meter.
    f. In addition to the testing specified to be performed by the installing contractor, the installation shall be subject to test by the acceptance inspector.

3.08 ACCEPTANCE TESTING

A. A written acceptance test procedure (ATP) for testing the fire alarm system components and installation will be prepared by the engineer in accordance with NFPA 72 and this specification. The contractor shall be responsible for the performance of the ATP, demonstrating the function of the system and verifying the correct operation of all system components, circuits, and programming.

B. A program matrix shall be prepared by the installing contractor referencing each alarm input to every output function affected as a result of an alarm condition on that input.

C. The installing contractor, prior to the ATP, shall prepare a complete listing of all device labels for alphanumeric annunciator displays.

D. Loop Resistance Tests: Measure and record the resistance of each circuit with each pair of conductors in the circuit short-circuited at the farthest point from the circuit

origin. The tests shall be witnessed by the owner and test results recorded for use at the final acceptance test.

E. Preliminary Testing: Conduct preliminary tests to ensure that all devices and circuits are functioning properly. After preliminary testing is complete, provide a letter certifying that the installation is complete and fully operable. The letter shall state that each initiating and indicating device was tested in place and functioned properly. The letter shall also state that all panel functions were tested and operated properly. The Contractor and an authorized representative from each supplier of equipment shall be in attendance at the preliminary testing to make necessary adjustments.

F. Final Acceptance Test: Notify the owner in writing when the system is ready for final acceptance testing. Submit request for test at least 14 calendar days prior to the test date. A final acceptance test will not be scheduled until megger test results, the loop resistance test results, and the submittals required in Part 1 are provided to the owner. Test the system in accordance with the procedures outlined in NFPA 72.

1. Verify that the control unit is in the normal condition as detailed in the manufacturer's operating and maintenance manual.
2. Test each initiating and indicating device and circuit for proper operation and response. Disconnect the confirmation feature for smoke detectors during tests to minimize the amount of smoke or test gas needed to activate the detector.
3. Test the system for all specified functions in accordance with the contract drawings and specifications and the manufacturer's operating and maintenance manual.
4. Visually inspect all wiring.
5. Verify that all software control and data files have been entered or programmed into the FACP.
6. Verify that Shop Drawings reflecting as-built conditions are accurate.
7. Measure the current in circuits to assure that there is the calculated spare capacity for the circuits.
8. Measure voltage readings for circuits to assure that voltage drop is not excessive.
9. Measure the voltage drop at the most remote appliance on each notification appliance circuit.

G. The acceptance inspector shall use the system record drawings in combination with the documents specified in this specification during the testing procedure to verify operation as programmed. In conducting the ATP, the acceptance inspector shall request demonstration of any or all input and output functions. The items tested shall include but not be limited to the following:

1. System wiring shall be tested to demonstrate correct system response and correct subsequent system operation in the event of:
    a. Open, shorted and grounded signal line circuits.
    b. Open, shorted and grounded notification circuits.
    c. Primary power or battery disconnected.
2. System notification appliances shall be demonstrated as follows:
    a. All alarm notification appliances actuate as programmed.
    b. Audibility and visibility at required levels.
3. System indications shall be demonstrated as follows:
    a. Correct message display for each alarm input at the control display.
    b. Correct history logging for all system activity.
4. System off-site reporting functions shall be demonstrated as follows:
    a. Correct zone transmitted for each alarm input.
    b. Trouble signals received for disconnect.
5. Secondary power capabilities shall be demonstrated as follows:
    a. System primary power shall be disconnected for a period of time as specified herein. At the end of that period, an alarm condition shall be created and the system shall perform as specified for a period as specified.
    b. System primary power shall be restored for forty-eight hours and system-charging current shall be normal trickle charge for a fully charged battery bank.
    c. System battery voltages and charging currents shall be checked at the fire alarm control panel.

3.09 DOCUMENTATION

A. System documentation shall be furnished to the owner and shall include but not be limited to the following:
    1. System record drawings and wiring details including one set of reproducible drawings, and a CD-ROM with copies of the record drawings in DXF format for use in a CAD drafting program.
    2. System operation, installation and maintenance manuals.
    3. System matrix showing interaction of all input signals with output commands.
    4. Documentation of system voltage, current and resistance readings taken during the installation, testing and ATP phases of the system installation.

5. System program showing system functions, controls and labeling of equipment and devices.
6. All applicable NFPA 72 commissioning reports.
7. Copies of all test records and inspection reports, together with the annual inspection program schedule established for the system, shall be submitted to the Authority Having Jurisdiction (AHJ) and provided to the Owner, per NFPA 72 and the project's Basis of Design.

3.10 PROTECTION

A. Remove and replace devices and panel components that are wet, moisture damaged, or mold damaged.

3.11 DEMONSTRATION

A. Instructor: Include in the project the services of an instructor, who shall have received specific training from the manufacturer for the training of other persons regarding the inspection, testing and maintenance of the system provided. The instructor shall train the employees designated by the owner, in the care, adjustment, maintenance, and operation of the fire alarm system.

B. Training sessions shall cover all aspects of system performance, including system architecture, signaling line circuit configurations, sensor and other initiating device types, locations, and addresses, fire alarm control panel function key operation, and other functions as designated by the owner.

C. Required Instruction Time: Provide 16 hours of instruction after final acceptance of the system, which exceeds the project's minimum 8-hour-per-system Owner training requirement. The instruction shall be given during regular working hours on such dates and times as are selected by the owner. The instruction may be divided into two or more periods at the discretion of the owner. One training session shall be videotaped by the contractor. Videotapes shall be delivered to the owner.

D. Provide a typeset printed or typewritten instruction card mounted behind a Lexan plastic or glass cover in a stainless steel or aluminum frame. Install the frame in a conspicuous location observable from the FACP. The card shall show those steps to be taken by an operator when a signal is received as well as the functional operation of the system under all conditions: normal, alarm, supervisory and trouble. The instructions shall be approved by the owner.

E. Comprehensive system troubleshooting training shall be provided for a single individual designated by the owner. This session shall be separate and distinct from the above-described sessions.

F. All training sessions shall be conducted following final system certification and acceptance. Three additional training sessions shall be provided for all security personnel on all shifts six months after final system certification.

G. All training sessions shall be conducted by an authorized fire alarm system distributor representative, who has received specific training from the manufacturer for the training of other persons regarding the inspection, testing, and maintenance of the system provided.

END OF SECTION 16200

SECTION 16300 NURSE CALL SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: A complete, working, digital IP-based Nurse/Patient Communications Network furnished, installed, tested, and commissioned as a complete system, including all wiring and equipment, for all patient care areas of the Owner's facility (referenced herein as the OWNER), including but not limited to patient room stations, corridor dome lights, nursing station master (console) stations, staff duty stations, emergency/Code Blue stations, sub-stations, wireless bed interfaces, network controllers, and all associated software and licensing required for a fully operational system. Per the Bridging Document, the nurse call system is a complete system furnished and installed under the Design-Build Contractor's (D&B Contractor's) scope of work, distinct from the structured cabling/telecommunications systems, which are rough-in (pathways, conduit, cable tray, and room provisioning) only under Section 16742.

B. If an operational function is specified that requires hardware or software to complete that specific function, then that software or hardware is part of this Section. The cost of any omission of software or hardware necessary to complete all operational functions outlined in this Section shall be borne by the D&B Contractor providing this system.

C. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16200 - Fire Alarm System (fire alarm auxiliary/supervised input to nurse call sub-stations; coordination of separate conduit and non-interference between systems; Disaster Control Center annunciation)
3. Section 16700 - Automatic Transfer Switches (Essential Electrical System Critical Branch source serving the nurse call system)
4. Section 16742 - Telephone and Data Raceway System (hospital LAN/VLAN uplink pathway, SIP telephony interface coordination; cabling and active network equipment outside this Section's D&B scope where furnished by the Owner's structured cabling contractor)

D. All Nurse Communications Network devices shall be ANSI/UL 1069 listed. This includes routers, hubs, switches, and room control devices. The nurse call network shall be a United States Food and Drug Administration (FDA) Registered Device and the system manufacturer shall be an FDA Registered Operator. Field wiring shall be CAT 5E or CAT 6 cable for station/data wiring, with control wiring for power distribution and very long runs, and an optional fiber backbone where distances exceed normal Ethernet limitations. All station equipment shall use plug-on

connectors, and all switches, routers, and controllers shall utilize standard RJ-45 modular connections. All remote devices utilizing standard structured cabling shall be capable of PoE (Power over Ethernet) or powered within the CAT 5E/CAT 6 cable jacket. Systems that require separate DC power to devices, remote power supplies, or heavy DC wiring to each individual room shall not be accepted. Wiring shall be capable of installation in conduit or cable trays where shown on the Drawings. Nurse Communications cabling may be run along with other low-voltage and data cables where permitted by code, but shall be separated from any high-voltage AC or DC wiring exceeding 90 volts or in violation of any national or Puerto Rico local electrical code.

E. The system shall be ANSI/UL 1069 listed as a Nurse Communications Network by UL LLC; systems listed by any other nationally recognized testing laboratory (NRTL) will not be accepted. The system shall be capable of interconnecting with the hospital's LAN using a minimal single Ethernet 100 Mbps (or optionally 1 Gb) connection to accomplish all information exchange, coordinated with Section 16742.

F. The OWNER will provide one VPN connection for the servicing contractor to diagnose maintenance issues and maintain the system offsite. Diagnostic software shall be web-based and permit e-mail notification of high-level alarms. All software applications shall be HIPAA (Health Insurance Portability and Accountability Act) compliant and shall allow for patient name aliases and alternative display methods.

G. The overall Nurse Communications Network shall utilize VoIP communications between the nurse consoles, wireless telephones, and controllers. Any nurse call console shall be able to answer any patient call placed in the network. The communication standard shall be SIP protocol when wireless telephones are integrated. The OWNER will not provide any analog ports to the nurse call network; the OWNER will supply or establish a telephony call network supporting the SIP protocol within the facility, coordinated with Section 16742. Systems requiring digital-to-analog converters will not be accepted.

H. Integration: Per the Bridging Document, the nurse call system shall integrate with the hospital telephone/paging system, shall have the capability to interface with the Building Management System (BMS) for alarm monitoring, and shall have the capability to interface with a Real-Time Location System (RTLS) if provided by the Owner.

I. The Network shall be designed and provided with capacity for future expansion to the remaining nursing units.

1.02 REFERENCES

ANSI/UL 1069, Standard for Safety for Hospital Signaling and Nurse Call Equipment (current edition); National Electrical Code (NEC/NFPA 70), including Article 517 (Health Care Facilities) applicable to wiring in patient care spaces; NFPA 99, Health Care Facilities Code, and NFPA 99 requirements for hospital occupancies; FGI Guidelines for Design and

Construction of Hospitals; Joint Commission requirements for nurse call systems; U.S. Department of Labor / OSHA; National Electrical Manufacturers Association (NEMA) installation standards. A fully digital, IP-based nurse call system shall be provided throughout all patient care areas per FGI Guidelines and NFPA 99 requirements for hospital occupancies, per Bridging Document Section 9.2.

1.03 QUALITY ASSURANCE

A. Installer shall be an Authorized Distributor for the product supplied; an Authorized Distributor letter from the manufacturer shall be provided upon request of the specifying authority.

B. Installer shall hold applicable Commonwealth of Puerto Rico or regional licenses; copies available upon request.

C. Installing technicians shall hold a certificate of successful completion of the manufacturer's installation/training school for the equipment proposed; letter from manufacturer stating technician qualifications available on request.

D. Installing technicians shall hold certificate(s) of completion of applicable network certifications (e.g., Cisco or Microsoft); copies available on request.

1.04 SYSTEM DESCRIPTION

A. System hardware shall consist of a nurse call network comprised of VoIP nurse consoles, nurse call network controllers, patient stations, power supplies with battery backup, dome lights, marquee controllers, annunciator panels, entertainment cords, call cords, pull-cord stations, emergency push-button (or pull-button) stations, wiring, and options such as bed side-rail interfaces, wireless bed interfaces, computer interfaces, and wireless/telephone network interfaces as shown on the Drawings. All equipment necessary to meet the intent of this Section, whether or not enumerated, shall be supplied and installed to provide a complete and operating nurse/patient communications network.

B. System hardware and firmware shall be the product of a single, reputable manufacturer with a proven history of product reliability and sole control over all source code. Manufacturer shall provide, free of charge, firmware/software upgrades for one year from installation for product feature enhancements, and a 5-year warranty on all manufactured hardware. System configuration programming changes shall not require exchange of parts and shall be executable remotely via VPN connection; suppliers whose equipment cannot support remote configuration/diagnostics via VPN, or requires part/chip exchange for configuration changes, are not acceptable.

C. All programming and firmware changes shall be accomplished on a working system without interruption to normal operation. All system switches and controllers holding firmware and system parameters shall have DUAL storage (A and B memory blocks) so the system remains fully functional on original firmware during updates,

switchable to new control software by a single system command, with automatic revert to previous firmware on update error or failure.

D. All wall-mounted stations shall be flush-mounted using snap-tight cover plates with slotted, adjustable sub-plates for squaring the vertical and horizontal fit; all screws shall be hidden.

E. All flush-mount station buttons shall use a bio-seal cover to facilitate use of disinfectant cleaners, consistent with infection-control requirements for patient care areas.

F. The entire network, including all sub-stations, shall be supervised. Station failure shall be reported to any designated console, PC, e-mail, or wireless device, with remote diagnostics to quickly locate the source of the problem.

G. Up to six (6) different staff levels may be defined within the nurse call network to facilitate workflow within and outside normal nurse call activity (e.g., environmental services, facilities, transportation, lab, pharmacy).

H. The nurse call network shall support a VLAN configuration to separate its activity from other hospital LAN traffic and shall be capable of spanning multiple subnets on the hospital's LAN, coordinated with Section 16742.

I. All specified equipment shall be manufactured using surface-mount technology (SMT), with manufacturing testing utilizing Automated Test Equipment (ATE). Manufacturer's testing procedures, including test equipment model numbers, serial numbers, and date of last calibration, shall be available upon request.

J. The nurse call network shall support a GUI interface on the hospital LAN providing an active call display board showing selectable data such as call type, call location, and patient name, plus historical call detail reports and exception reports, with content displayable in a selectable language (including Spanish, in recognition of the Puerto Rico project location).

K. The nurse call network shall support up to 255 call processes to facilitate workflow and call escalations to various staff levels and/or groups.

L. The nurse call network shall support any telephone device via the SIP open architectural interface.

M. The nurse call network shall support any data backup system.

N. The nurse call network shall provide data reporting capability for call response times, call types, exception reporting, and patient-level reporting data.

O. The nurse call network shall interface to an Admission, Discharge, Transfer (ADT) application using a standard HL7 interface to provide automatic updates of patient room/bed assignment.

1.05 SUBMITTALS

A. D&B Contractor shall submit six (6) complete submittal sets bound in a three-ring binder, continuous spiral binder, or plastic binding allowing the booklet to lie flat while open. Each booklet shall consist of:

1. Name of supplying contractor and project name.
2. Listing, in order, of component quantities, equipment manufacturer, model number, and description of each component supplied; if not the specified manufacturer's model, the specification paragraph corresponding to the equivalent specified model shall be listed alongside the submitted model number.
3. Support letter (dated within one year of submittal) from manufacturer stating the supplying contractor is an Authorized Distributor of the product being supplied.
4. Statement of 5-year warranty hardware from manufacturer, or vendor statement extending manufacturer's original warranty to 5 years.
5. Copy of installing technician(s) certificate of completion from the manufacturer's training school for the equipment proposed.
6. Contractor statement of how and when In-Service Training will be completed, including exact hours per system, procedures, training aids provided, and training conduct method.
7. Contractor statement of exactly how installed equipment and wiring will be tested, including manufacturer recommendations, prior to commissioning.
8. List of recommended spare parts to maintain all specified systems after the warranty period, with purchase price, turnaround cost, cost of an annual maintenance contract, and hourly labor rates (regular and emergency service), including any additional charges such as travel.
9. One catalog sheet per item of equipment listed above, in the same order, describing mechanical, electrical, and functional specifications, including a product photograph; clear photocopies of manufacturer's original catalog sheets are acceptable.
10. All inter-equipment wiring diagrams and drawings necessary to install the equipment, showing wiring types by wire gauge, conductor count, and manufacturer, updated prior to completion of work to reflect as-installed changes.

1.06 DEMONSTRATIONS

A. Demonstration equipment may be required to test functional operation of the Contractor's submitted equipment; Contractor shall be notified of demonstration dates and times. The OWNER and specifying authority shall have sole judgment as to whether a contractor/manufacturer meets or exceeds the specification.

B. All demonstrated equipment shall be of standard, current manufacture from a single manufacturer, meeting the same testing and conditions applicable to the manufactured equipment; custom or modified equipment shall not be demonstrated.

C. Where integrations are specified as part of this Project, those integrations shall be demonstrated fully functional (e.g., integration to a selected wireless vendor with voice capability and call display).

D. The OWNER and/or specifying authority may visit the manufacturer's facility to view functioning equipment or demonstrations and witness manufacturing/testing techniques.

1.07 SAMPLES

The OWNER/specifying authority reserves the right to request one each of terminal (station) equipment samples for the purpose of coordinating colors, aesthetics, and trim-plate sizing, supplied at no cost to the OWNER.

1.08 WARRANTY

A. The supplying contractor shall provide a system warranty including all necessary labor and equipment to maintain the system(s) in full operation for one year from the date of acceptance.

B. Manufacturer shall provide, free of charge, product firmware/software upgrades throughout the 1-year warranty period for product feature fixes.

C. The equipment (parts) warranty for all core system components, including control/switching equipment, power supplies, patient stations, sub-stations, and nurse consoles, shall extend to at least five (5) years. Warranty for ancillary devices such as pillow speakers and call cords shall extend to at least two (2) years.

D. After acceptance of the system(s), service shall be provided as follows:

1. Emergency Service: Provided 24 hours a day. When a total or catastrophic failure of equipment (e.g., a hub failure or nurse console failure) is reported to the contractor, a service person shall be on site within 2 hours of notification.

2. Routine Service: Provided within 4 business hours (9:00 a.m. to 5:00 p.m., Monday through Friday, excluding holidays) of notification. When a minor failure of equipment is reported (e.g., peripheral equipment such as control stations, entertainment speakers, corridor lights, pull-cord stations, normally affecting only one patient or patient room), a service person shall be on site within 24 hours of notification.

1.09 MAINTENANCE

A. Provide necessary spare parts, per Article 1.05.A.8 above, after commissioning of the system(s) and prior to final payment.

B. Provide tuition cost for one person designated by the OWNER to attend a service school held by the equipment manufacturer; transportation to the school shall be borne by the OWNER, with lodging, breakfast, and lunch borne by the manufacturer or supplying contractor.

C. The OWNER may elect to have the supplying contractor maintain the system(s) under a maintenance contract at the same service levels as the warranty period, with all labor and equipment costs covered; supplying contractor shall state exact billing amounts, billing periods, all associated costs, and any items excluded from the service/maintenance agreement. Firmware/software upgrades shall be available with a software maintenance agreement.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

Approved manufacturer is Rauland-Borg Corporation, or other Owner-approved equal.

2.02 NURSE CALL NETWORK WIRING

All Nurse Call Network wiring shall be CAT 5E or CAT 6 only. Plenum-rated wire shall be used in open areas; standard CAT 5E or CAT 6 within conduit. System shall be capable of injecting DC power into a CAT 5E or CAT 6 run, for additional rooms or long runs, via a separate DC cable pair to a remote location.

2.03 NURSE CALL CONTROLLER(S)

A. Furnish, as needed in each nursing unit, a nurse call network controller providing:

1. Communications between consoles and rooms, sub-stations, and pillow speakers within each station loop.
2. CAT 5E or CAT 6 wiring standard utilizing PoE between console and nurse call controllers, and local wiring to power room station equipment and dome lights.
3. Capacity for up to 92 corridor lights and/or bus devices operated with a single controller.

B. Controller shall be life-safety grade, requiring no regular rebooting for continued basic system functions, and capable of stand-alone operation should loss of network communication occur; personal computers may not be used for this purpose and shall only be permitted outside the UL-listed nurse call network on the customer-supported LAN.

C. Nurse call controller(s) shall connect to the hospital's LAN via Ethernet switches; nurse call servers connected to the hospital's LAN shall run specialized software for hospital data resources and telephone communications resources.

2.04 VOIP NURSE CONSOLES

A. Furnish, as shown on the Drawings, an ANSI/UL 1069-listed VoIP nurse console capable of:

1. Color display.
2. 12- or 24-hour time display and synchronization to the optional reporting server, including daylight saving time changes.
3. Display of up to 3 incoming calls, each with an individual elapsed timer, with the ability to scroll to see additional incoming calls.
4. Power-over-Ethernet connection to an ANSI/UL 1069-listed Ethernet controller; no local power supplies required.
5. Choice of hands-free communication through built-in speaker/microphone or private handset conversation.
6. Up to 32 user-configurable soft keys, with 4 buttons, 8 screens deep.
7. Optional tone/mute of calls in progress.
8. Ability to block all nurse call loudspeaker paging (password-protected) to facilitate a low-noise patient environment.
9. Ability to swing an individual room or group of rooms by touching one labeled touch point, from any console located anywhere on the network; GUI interface for authorized end users to modify wireless phone or console coverage.
10. Programmable to receive any call not answered by another console, or any call from a failed/unplugged console (call orphaning).
11. Built-in keypad for dialing.
12. Self-contained unit occupying not more than 88 square inches of desk space, desk- or wall-mountable.
13. Manual Staff Follow function forwarding call tones for a prescribed area to the room station speaker where staff are located, silenced by pressing the call button at that station and automatically restored on a new call.
14. Selectable display language, including Spanish, consistent with the Puerto Rico project location.

2.05 ANNUNCIATORS AND MARQUEES

A. Annunciator Panels:

1. Small self-contained units; each panel shall include 36 room indicator points, each with two LED indicators and space for point labeling.
2. LEDs shall provide visual annunciation of room status, including calls pending, service requirements pending, and staff presence; variable colors and flash rates shall differentiate annunciation types, with a minimum of six distinct tone types for different call types.

3. Up to eleven expanders may be added to a panel, each adding 36 additional room points.
4. Panel shall provide independent volume controls for day/night call-in tones and a mute button to temporarily suppress tones for pending calls.
5. Panel may be desk- or wall-mounted.
6. Panel shall employ a modular quick-disconnect connector permitting removal/replacement without removing system power.

B. Marquee Panels:

1. Remote annunciation of call-ins by alphanumeric display of room number, bed number, and call priority, with distinctive color options per priority.
2. Calls scroll in order of highest priority (or longest pending), with a configurable pause between scrolling calls.
3. Time-of-day display when the panel is idle.
4. Optional speaker for tone indication of call-ins.

2.06 PATIENT STATIONS

A. Provide single- or dual-patient stations as shown on the Drawings.

B. Patient station modules shall be capable of:

1. Muting entertainment audio when the intercom speaker is in use.
2. One DIN pillow speaker/call cord receptacle per bed.
3. Optional module for bed side-rail controls.
4. Lighting control interfacing directly to low-voltage controllers.
5. No dummy plugs required.
6. Cancel button cancelling any call on that station and any other station in the room programmed for universal room cancel.
7. Continuous supervision.
8. Hot-swap exchange of a station without removing system power or powering down the local controller.
9. Per-station-basis programming of each bed and entertainment/call cord receptacle to custom call priorities.
10. Custom printed text, colors, or logos on pushbuttons or faceplates.

2.07 STAFF STATION

Provide, as shown on the Drawings, a staff station providing two-way hands-free intercom to its assigned nurse console(s) via a call-in button, mounted in a standard single- or dual-gang electrical box.

2.08 DUTY STATION

Provide, as shown on the Drawings, a duty station providing remote annunciation of assigned patient stations and sub-stations via 5 LEDs and multiple call tones, mimicking corridor light activity for the assigned nursing area, plus two-way intercom to the assigned nurse console(s). Call tones at the duty station shall be identical to and synchronized with tones at the closest nurse console; the call-in tone shall be mutable without cancelling the call, with the next call-in un-muting the station (mute feature defeatable where required by local jurisdiction). The duty station shall be programmable for a day/night volume-change schedule to minimize patient noise. Unit shall mount in a standard single- or dual-gang electrical box.

2.09 SUB-STATIONS

A. Provide, as shown on the Drawings, sub-stations flush-mounted in a single-gang box. Sub-station cancel buttons shall follow the cancel policy defined in the system configuration; high-priority calls typically cancellable only by the initiating station, lower-priority calls cancellable by any associated station in the room.

B. Individual sub-stations shall include:

   1. Pull-cord station (non-audio), IP68 (IEC 60529) rated, with replaceable pull-cord and easily cleaned surface, configurable to be cancelable only within the room.

   2. Pull-cord station with built-in speaker module, providing all capabilities of the pull-cord station (except IP68 rating) plus patient communication, with a pushbutton for functions such as a "Return to Bed" call.

   3. Four-button workflow station with four backlit buttons, each configurable to any call priority or staff registration level.

   4. Code Call stations equipped with call button, reset button, and call-assurance LED, backlit for low-light identification, with digital clock/timer and count-up timer interface. Per Bridging Document Section 9.2, Code Blue/Code Call stations shall be provided in ORs, Trauma Stabilization, ICU, and patient rooms; activation of a code call shall activate audible annunciation throughout the applicable zone and shall report to the Disaster Control and Monitoring Center on Level 9, coordinated with Section 16200 (Fire Alarm System) and the Disaster Control Center communications equipment.

   5. Two-jack auxiliary alarm station allowing connection of external patient monitoring devices via two 1/4-inch jacks, for individual annunciation of patient

alarms to nurse call consoles and wireless devices; each jack programmable for one of 255 call processes, latching or non-latching.

6. Dry-contact closure input, where noted, from an external device to activate a call into the nurse communications network.
7. Output relay station, where noted, allowing up to 4 external devices per station to be controlled from the nurse call network.
8. Isolated, supervised input for a fire alarm or other auxiliary device, coordinated with Section 16200.
9. Tamper-resistant, high-security stations for behavioral health areas or locations subject to physical damage, with 11-gauge stainless steel faceplate and tamper-resistant button(s), speaker, and call-assurance light.

2.10 CORRIDOR LIGHTS AND DOMELESS CONTROLLERS

A. Provide, as shown on the Drawings, the proper type of corridor light or domeless controller. Corridor lights shall contain up to five sections, each lighted by a long-life, single-color LED, with a diffusion lens allowing 180-degree horizontal visibility of call lights. Corridor lights shall be capable of:

1. Multiple colors and programmable flash rates/patterns to indicate pending calls, service requirements, and staff registration.
2. Serving as the hub for all room wiring, with all field wire connections accomplished using modular connectors.
3. A heart-beat LED, visible to service personnel, indicating proper unit function.

B. Corridor light and domeless controller intelligence shall support up to 6 or 16 room devices respectively, allowing any room station to be associated with any other room in the system (e.g., associated call stations and cancelling options, door monitoring).

C. Staff registration shall be indicated by a custom color per staff level (e.g., green = nurse, amber = LPN, blue = doctor).

D. Domeless controllers shall have all functions of the corridor light, less LEDs.

E. In the unexpected event of communications loss with the nurse call controller, corridor lights and domeless controllers shall enter a local room failsafe mode showing all calls in the hallway via LED indicators.

2.11 PATIENT ENTERTAINMENT SPEAKERS/CALL CORDS

A. Patient Entertainment Speakers/Call Cords shall be provided as indicated on the Drawings, ANSI/UL 1069 and CE listed as an integral part of the core system listing (devices carrying only component listings are not acceptable).

1. Standard Call Cords: pendant type with a single easy-to-activate call button, DIN-style male plug, and sheet clip; cable minimum 9 ft (2.75 m).

2. Specialty Call Cords: provide one of each type for every ten beds - (a) Oxygen/Geriatric Pressure Ball Cord, pneumatically controlled switch for oxygen-enriched environments, 6 ft (1.8 m) cord, DIN male plug, sheet clip; (b) Geriatric Pressure Pad, 6 ft (1.8 m) cord, DIN male plug, sheet clip.
3. Patient Entertainment Speakers for patient call-in and entertainment system control/audio, with: raised, textured membrane control buttons (Nurse Call button Braille-embossed), Television/Radio controls (minimum TV On/Off, Channel Up/Down, Volume Up/Down) analog or digital as required by facility televisions, 10 ft (3 m) modular replaceable cord with sheet clip, liquid-resistant speaker, integral Call Assurance LED, and optional numeric keypad/controls for up to 2 external light control modules.

2.12 WIRELESS DEVICE INTERFACES

A. The Telephone Interface shall receive, via an Ethernet connection, VoIP connectivity using the standard SIP protocol, per the facility's actual telephony configuration:
   1. VoIP/SIP wireless phone system with an IP/SIP PBX: software module shall directly support an interface through the OWNER-provided Telephony/SIP Call Server communicating to the nurse call network; systems using only analog station/trunk ports to communicate with SIP wireless phones are not acceptable.
   2. VoIP/SIP wireless phone system with a non-SIP PBX: software module shall interface through the OWNER-provided Telephony/SIP Call Server; OWNER will also provide a Telephony/SIP Gateway; analog-only interfacing is not acceptable.
   3. Wireless phone system not SIP-compatible, with a VoIP/SIP PBX: supplying contractor shall provide middleware interfacing the non-SIP wireless phone display to the nurse call system; OWNER provides wireless phone system OAI and a Telephony/SIP Gateway.
   4. Wireless phone system not SIP-compatible, with a non-SIP PBX: supplying contractor shall provide middleware as above; OWNER provides wireless phone system OAI and a Telephony/SIP Gateway.

2.13 DATABASE MANAGEMENT

Provide standard ODBC-compliant databases, capable of backup using the facility's standard backup processes and disaster recovery methods, coordinated with the Disaster Control and Monitoring Center per Bridging Document Section 9.5.

2.14 SOFTWARE APPLICATION

A. The Software Application shall be provided with the system for nurse call activity display, recording, and reporting; patient management; user management; and configuration of the Software Application.

B. The Software Application shall be installed on an external server connected to the Nurse/Patient Communication System.

C. The Software Application shall support networked operation on the hospital LAN, allowing users with LAN access to generate reports from local workstations.

D. The Software Application shall provide selectable display language, including Spanish.

E. Activity Board Display: Provide an activity board display on up to (10) networked OWNER-provided PCs or smart TVs meeting the manufacturer's minimum specifications (touch screen or standard keyboard/mouse), displaying all active nurse calls and statuses, including staff registrations, with up to (11) optional configurable columns: location name, room name, bed number/name, call type, service, patient first/last name, patient sex, patient age, doctor name, and notes.

F. Reporting: The Reporting Module shall allow users (subject to username/password access control) to generate and print reports on system activity, including call priority, room number and patient information, call placed time, service reminder set, and staff registration, with reports including Detailed Call Data by Unit, Summary Call Data by Unit, Summary of Call Data by Room/Bed, Summary of Call Data by Patient, and an Exception Report for response times exceeding user-defined limits. The module shall support user-configured Template Reports and Recurring Reports (automatically executed and delivered via e-mail), configurable by report name, recipients, CC, frequency, day(s) sent, report selection, start date, end date/no end date.

G. Patient Management: The nurse call system shall provide connection to an ADT application via a standard HL7 interface, providing patient name, date of birth, sex, doctor, and room-bed assignment; manual edits shall not be permitted while the ADT interface is enabled. The Patient Management Module shall allow viewing of patient details (last/first name, middle initial, date of birth, sex, doctor, location, room-bed, notes) and, where the ADT interface is not enabled, allow authorized users to manually add and edit that same patient information.

H. Check-In Function: The nurse call system shall provide a method to configure a once-per-day event (alarm) requiring the press of a designated station button within a configurable time window to cancel the event, reporting and displaying all rooms where the button was not pressed within the window, usable for patient/resident check-in, medication reminders, or similar recurring events.

I. User Management: The User Management Module shall allow authorized users to view a complete list of system users (username, last/first name, middle initial, unit(s), last login, can-edit-patients flag, active flag) and to add and edit users, including username, name, password, user type, patient-edit rights, and unit access.

J. Activity Board Management: The Activity Board Management Module shall allow authorized users to view a complete list of activity boards and add up to (10) activity

boards, each configurable with the same display columns as the Activity Board Display (Article 2.14.E).

2.15 WIRELESS BED INTERFACE

A. Provide, one per bed, a Wireless Wall Unit providing:

1. A wireless (RF) link between the nurse call system and a Feature Bed, receiving any patient call or bed-exit call from the associated bed.
2. Plug-in connection to a standard 37-pin wall receptacle.
3. LINK LED and audible tone confirmation when successfully linked to the Bed Unit.
4. A "bed out" call placed in the system if the bed is moved out of range.
5. A Cancel button to silence tone notifications such as "Bed Out" or "Low Battery."
6. Power from the nurse call system or via an A/C adapter.

B. Provide, one per bed, a Wireless Bed Unit for use with the Wireless Wall Unit above, providing:

1. A wireless (RF) link between the nurse call system and a Feature Bed in conjunction with the Wireless Wall Unit.
2. Connection to a 37-pin socket receptacle on a Feature Bed (e.g., Hill-Rom or Stryker Feature Beds with side rails).
3. Low-Battery LED indicator and tone; unit powered by 3 AA batteries.

C. A LINK button on each unit shall provide LINK LED and audible tone confirmation of successful linking; an Unlink button shall allow de-association of the Wall and Bed unit for bed removal (placing a "Bed Out" call), with a LINK Reminder tone if an unlinked Bed Unit senses an unlinked Wall Unit after 2 minutes.

2.16 NETWORK CONCENTRATOR (OPTIONAL)

A. Provide a module capable of allowing the nurse call network to span multiple VLANs/subnets on the hospital's LAN.

B. This module shall allow nurse call network controllers on different VLANs/subnets to communicate with each other across the hospital's LAN.

C. The nurse call network shall support VLANs to separate its activity from other hospital LAN traffic, coordinated with Section 16742.

PART 3 - EXECUTION

3.01 SUPERVISION

A. Only factory-certified installers shall install, service, and maintain the specified network system.

B. The equipment manufacturer's engineer, or a designated agent, shall inspect the installation and operation of the network to confirm compliance with all standards listed in Article 1.02.

3.02 NEEDS ASSESSMENT

Contractor shall provide a Nurse Call Orientation meeting educating key clinical staff on the specific hardware (and integrations) purchased, including typical associated workflow processes, concluding with instruction on the process and data collection methods for subsequent one (1) hour Unit Break-out Meetings with key unit staff. Unit Break-out meetings shall include review of floor plan drawings, unit-specific details, coverage and priorities of calls, staffing patterns, and other details affecting training. In-service scheduling materials will be provided, and a staff member list, if needed, will be completed for inclusion in the software. Information gathered shall be provided to the Contractor to program the network software and for use in In-Service Training.

3.03 IN-SERVICE TRAINING

Contractor shall provide thorough training of all nursing staff assigned to nursing units receiving new networked nurse/patient communications equipment, developed for two audiences: floor nurses/staff (operational perspective) and unit secretaries or other staff whose responsibilities include answering patient calls and dispatching staff (dispatch perspective). A separate training room shall be set up for individualized training utilizing an in-service training unit, prior to cutover of the new system.

3.04 WIRING

A. Contractor shall terminate all wiring with manufacturer-approved connectors; use of wire nuts is prohibited.

B. All wiring shall be free from shorts and faults, UL listed, and installed per the National Electrical Code (NFPA 70), including Article 517 (Health Care Facilities) for wiring in patient care spaces.

C. Nurse/patient communications network wiring shall not be run in the same conduit with other systems (e.g., Class 1 AC power distribution, fire alarm, entertainment systems, lighting controls).

3.05 ELECTRICAL POWER CONNECTIONS

A. The D&B Contractor shall provide a dedicated 120/240 VAC, 60 Hz conduit feed into each nurse call equipment cabinet, with no other devices connected directly to it. A 20 A circuit breaker in the electrical sub-panel, labeled "NURSE CALL," shall control this circuit. Per Bridging Document Section 9.2, this electrical circuit shall be

connected to and powered from the Essential Electrical System Critical Branch (Section 16700, Automatic Transfer Switches) for automatic power transfer during loss of normal utility power, consistent with NFPA 99 requirements for hospital occupancies; a local UPS shall be provided as backup for the head-end controller.

1. Large portions of the facility may require multiple equipment cabinets separated between floors and buildings, consistent with the multi-level nursing unit layout of this Project.
2. Care shall be taken to connect power supply common-mode lines where DC current can flow.
3. Large separation between controllers and power supplies should be connected by fiber optic cable to reduce common-mode power supply issues.

B. Connect all network system power supplies and equipment cabinets to a common earth ground utilizing a 14 AWG or larger solid conductor, at minimum the same conductor size as the AC feed wires.

3.06 ENVIRONMENTAL PROTECTION

Ensure all network control equipment is accessible for service. Contractor shall notify the specifying authority if the designated equipment closet does not meet manufacturer's requirements for heat, radiation, or static electricity.

3.07 PROTECTION OF NETWORK DEVICES

Contractor shall protect network devices during unpacking and installation by wearing manufacturer-approved ESD wrist straps tied to chassis ground, meeting OSHA requirements for prevention of electrical shock in the event a technician contacts high voltage.

3.08 CLEANING AND PATCHING

A. Contractor shall keep the work area clear of debris and clean the area daily upon completion of work.

B. Contractor shall patch and paint any wall or surface disturbed by execution of this work.

3.09 DRAWINGS

Provide as-built drawings of all installed network components and associated wiring on the building plans. Final payment for this Section's work will not be authorized unless these drawings are supplied.

END OF SECTION 16300

SECTION 16440 DISCONNECT SWITCHES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Heavy-duty, enclosed, fusible and non-fusible safety switches, and individual equipment disconnecting means, for motors, motor-driven equipment, variable frequency drives (VFDs), and other utilization equipment throughout the Project, including the air handling units (AHUs), cooling tower fans, pumps, and fire pumps served from 480 V panelboards per the Bridging Document.

B. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods.
2. Section 16155 - Motor Power and Control Wiring (power and control wiring and connections to and beyond the disconnect switches specified in this Section).
3. Section 16470 - Panelboards (source panelboards feeding the branch circuits protected and disconnected by this Section's switches).

1.02 REFERENCES

NEC Article 404 (Switches); Article 430 (Motors, Motor Circuits, and Controllers); Article 440 (Air-Conditioning and Refrigerating Equipment); Article 695 (Fire Pumps); Section 110.25 (identification of disconnecting means, including padlocking provisions); UL 98 (Enclosed and Dead-Front Switches); NEMA KS 1 (Enclosed Switches); NFPA 20 (Stationary Pumps for Fire Protection); NFPA 70E (arc flash).

1.03 SUBMITTALS

A. Submit manufacturer's literature and technical data for each disconnect switch type and rating before starting work.

B. Submit an equipment schedule cross-referencing each disconnect switch to the motor, VFD, or other equipment served, its horsepower/ampere rating, and fuse size (where fusible), coordinated with the Mechanical Contractor's VFD submittals and with Section 16155.

1.04 QUALITY ASSURANCE

Materials shall bear Underwriters Laboratories (UL) labels. Disconnect switches shall be UL listed, horsepower and I2t rated for the load served, and lockable/padlockable in the OFF position per NEC 110.25.

1.05 DESIGN REQUIREMENTS

A. Provide each motor with an in-sight disconnecting means, or a disconnecting means capable of being individually locked in the open position, when required by NEC Article 430/440 and where shown on the Drawings.

B. Mechanical equipment disconnects: AHUs, cooling tower fans, pumps, and fire pumps served from 480 V panelboards shall each be provided with an individual disconnect means at the equipment per the Bridging Document. VFDs (chilled water pumps, condenser water pumps, cooling tower fans, AHU fans, DOAS units, booster pumps) are furnished by the Mechanical Contractor; this Section's Contractor shall furnish and install the disconnect switch ahead of each VFD, coordinated with Section 16155.

C. Fire Pump Disconnect: Where a disconnect means is required ahead of the fire pump controller by the controller's listing, provide it per NFPA 20 and NEC Article 695, coordinated with the fire protection (mechanical) Contractor and with the power wiring of Section 16155.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Disconnect Switches:

1. General Electric (GE).
2. Eaton.
3. Hubbell.
4. Schneider Electric.

2.02 EQUIPMENT

A. Disconnect switches shall comply with NEMA KS 1 for Type HD and shall be of heavy-duty type, enclosed, of quick-make, quick-break construction. Rating shall be as indicated on the Drawings. Switches shall be horsepower and I2t rated, UL labeled.

B. Disconnect Switch Enclosure:

1. NEMA 1 or NEMA 12, as shown on the Drawings, for indoor use.
2. NEMA 3R, of stainless steel or fiberglass construction, for outdoor, exterior, and coastal-exposed use, for corrosion resistance in Puerto Rico's coastal/marine environment, per Section 16100, Section 1.4.E.

C. Disconnect switch operating handle shall be of the insulated, box-mounted type, directly driving the switch mechanism, suitable for padlocking in the OFF position.

D. Defeatable, front-accessible, coin-proof interlocks shall be provided to prevent opening of the cover when the switch is in the ON position, and to prevent turning the

switch ON when the door is open. A securely fastened metallic nameplate shall include a highly visible ON-OFF indication.

E. Motor Disconnect Means: Provide each motor with an in-sight disconnect means, when required by NEC, and where shown on the Drawings.

F. Provide fuses for disconnect switches so indicated. Fuses shall be dual-element, time-delay type, as specified on the Drawings.

PART 3 - EXECUTION

3.01 EXAMINATION

Do not proceed with the work of this Section until conditions detrimental to the proper and timely completion of the work have been corrected in an acceptable manner.

3.02 INSTALLATION

A. Install disconnect switches vertically, with the top not more than 6 feet above the floor, and rigidly and securely attached to the building, anchored to resist seismic and wind loads per the Puerto Rico Building Code. Disconnect switches shall not depend upon conduit for support.

B. Optional Mounting:

1. Unistrut: Mount disconnect switches on Unistrut P-3000 mounting channels at top and bottom, secured similarly to the wall.

C. Label switch covers in 1-inch high stenciled letters showing the equipment served, per Section 16100, Section 2.6, including arc-flash incident energy labeling per NFPA 70E.

3.03 FIELD QUALITY CONTROL

Verify correct operation, fuse sizing (where fusible), and lockout/padlocking capability of each disconnect switch prior to Substantial Completion.

END OF SECTION 16440

SECTION 16470 PANELBOARDS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: 480Y/277 V distribution (main) panelboards and 208Y/120 V branch circuit panelboards, including the main distribution panelboards located in the Basement Main Electrical Room and the distribution and branch panelboards located in each floor electrical room throughout the facility; associated 480-120/208 V dry-type step-down transformers; surge protective devices (SPDs) at panelboard and transformer secondary locations; and the Operating Room Isolated Power Panels (IPPs) and Line Isolation Monitors (LIMs) serving the Trauma Operating Rooms. Panelboards are fed downstream of the four load-category Automatic Transfer Switches (Life Safety, Critical, Equipment System, and Optional Standby) and, for the Optional Standby (non-essential) and Critical Branch isolated power circuits, downstream of dedicated isolation transformers.

B. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16120 - Wire and Cable
3. Section 16140 - Wiring Devices (isolated ground, hospital-grade, GFCI, and IPP receptacles fed from panelboards specified in this Section)
4. Section 16440 - Disconnect Switches
5. Section 16600 - Double-Ended Substation (upstream distribution source)
6. Section 16700 - Automatic Transfer Switches (normal/emergency source ahead of distribution panelboards)

1.02 REFERENCES

NEMA PB-1 (Panelboards); UL 67 (Panelboards); UL 489 (Molded Case Circuit Breakers); UL 1449 (Surge Protective Devices); NEC (NFPA 70), latest edition adopted in Puerto Rico, including Article 240 (Overcurrent Protection), Article 408 (Switchboards, Switchgear, and Panelboards), Article 250 (Grounding and Bonding), Article 517 (Health Care Facilities, including 517.16 Isolated Ground and 517.160 Isolated Power Systems), and Articles 700/701/702 (Emergency, Legally Required Standby, and Optional Standby Systems); NFPA 99 (Health Care Facilities Code), latest edition, Essential Electrical System and Category 1 patient care space requirements; NFPA 70E (arc flash); IEEE 1584 (arc flash incident energy calculations); Puerto Rico Building Code (PRBC), incorporating the 2018 IBC with Puerto Rico amendments, for seismic and wind-load anchorage of equipment.

1.03 SYSTEM DESCRIPTION

A. Performance Requirements: Materials shall bear Underwriter Laboratories (UL) labels.

B. Panelboards used as service entrance equipment shall be UL labeled.

C. Panelboards shall be arranged so that each electrical room is provided with panelboards fed from each of the applicable load categories - Life Safety, Critical, Equipment System, and Optional Standby (Non-Essential) - as established by the Bridging Document; Essential and Optional (non-essential) panelboards shall be separate, physically and electrically, and shall not share a common bus, cabinet, or enclosure.

1.04 SUBMITTALS

A. Submit manufacturer's literature and technical data before starting work, including shop drawings for each panelboard showing bus rating, breaker schedule, AIC rating, and enclosure type.

B. Panelboard schedules coordinated with the building load calculation and the short-circuit and protective device coordination study; submit at Design Development phase, consistent with the fault current study required for the upstream double-ended substation (Section 16600).

C. Product data for isolation transformers, Line Isolation Monitors (LIMs), and surge protective devices (SPDs).

D. Arc flash hazard analysis and label content for all panelboards, coordinated with the facility-wide arc flash study.

1.05 QUALITY ASSURANCE

A. Panels tested and listed according to UL 67 and bearing an integrated short circuit rating shall be determined by the short circuit (fault current) study performed for the electrical system, with 10,000 A minimum AIC where no higher fault current governs.

B. Because the facility is served by a double-ended substation with two 3,750 kVA transformers and a 5,000 A copper switchgear bus rated for a high available short-circuit current, panelboards located electrically close to the substation and floor distribution boards are likely to require AIC ratings well above the 10,000 A minimum; each panelboard's AIC rating shall be verified against, and shall not be less than, the available fault current at its location as determined by the fault current study, not merely the 10,000 A default.

C. Panelboards shall be fully rated for the available fault current at each location; series-rated combinations are not permitted unless specifically reviewed and accepted in writing by the Owner and Engineer of Record.

D. Where new circuit breakers are specified to be installed within existing panelboards, they shall be compatible in terms of manufacturer, type, and AIC rating.

1.06 DESIGN REQUIREMENTS

A. Four Load Categories: Main distribution panelboards and floor distribution panelboards shall be fed from the Life Safety, Critical, Equipment System, and Optional Standby (Non-Essential) branches established by the automatic transfer switches (Section 16700); each electrical room shall include both an Essential power panelboard (or panelboards) and an Optional (non-essential) power panelboard, physically and electrically separated per NEC 700.10 and NFPA 99. The Life Safety Branch and the Critical Branch shall not be combined on a single panelboard or bus.

B. Minimum 10% spare capacity (spare breaker positions and bus/frame capacity) shall be provided in all panelboards, per the Bridging Document's general spare capacity requirement and Section 16100, Section 1.4.A.

C. Seismic and Environmental: Panelboards and their supports shall be anchored/braced for the project's seismic design category per the Puerto Rico Building Code. Panelboards exposed to the weather, or installed in exterior, damp, or coastal-exposed locations, shall have a NEMA 3R stainless steel raintight enclosure, or NEMA 4X in corrosive environments, suitable for Puerto Rico's coastal/tropical climate and 180 mph design wind speed where applicable, per Section 16100, Section 1.4.E.

D. Patient Care Grounding: Panelboards serving patient care areas shall include an equipment grounding bus and, where required by NEC 517.16 and the Bridging Document (nursing stations, imaging equipment, and other sensitive electronic equipment locations), an isolated ground bus, insulated from the enclosure, for isolated ground branch circuits specified in Section 16140.

E. Operating Room Isolated Power: Each of the five (5) Trauma Operating Rooms shall be served by two (2) dedicated Isolated Power Panels (IPPs) per NFPA 99 and NEC 517.160 - one fed from the Optional Standby (Non-Essential) branch and one fed from the Critical Branch - each with its own isolation transformer and Line Isolation Monitor (LIM), physically and electrically kept separate from each other and from all other Essential Electrical System wiring per NEC 700.10 and NFPA 99.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Panelboards:

1. General Electric.
2. Schneider.
3. Eaton.
4. Bender (Isolation Panelboards)

2.02 DISTRIBUTION PANELBOARDS

480Y/277 V main distribution panelboards, located in the Basement Main Electrical Room and floors electrical rooms, fed from the double-ended substation distribution breaker sections (Section 16600) through the applicable load-category automatic transfer switch (Section 16700). Copper bus; main circuit breaker, main lugs only, or sub-feed lugs as required; molded case circuit breakers, 400 amperes and over, tested and UL labeled per UL 489; bus and breaker AIC rated per Section 1.5 of this Section.

2.03 BRANCH CIRCUIT PANELBOARDS

208Y/120 V panelboards, fed from the associated 480-120/208 V dry-type step-down transformer, provided in Essential and Optional (non-essential) pairs in each electrical room per Section 1.6.A of this Section. Circuits serving patient care areas coordinated with the hospital-grade, isolated ground, GFCI, and tamper-resistant devices specified in Section 16140.

2.04 PANELBOARD INTERIORS

A. Interiors shall be factory assembled and designed to allow switching and protective devices to be replaced without disturbing adjacent units, without removing the main bus connectors, and allowing circuits to change without machining, drilling, or tapping.

B. Branch circuits shall be arranged using double row construction unless narrow column panels are indicated. A nameplate shall be provided listing panel type and ratings. Circuit breakers shall be bolt-on type.

C. Unless otherwise noted, full size insulated neutral bars shall be included. Bus bar taps for panels with single pole branches shall be arranged for sequence phasing of the branch circuit devices. Neutral bussing shall have a suitable lug for each outgoing feeder requiring a neutral connection. A ground bus shall be provided in all panels, and an isolated ground bus shall be provided where required by Section 1.6.D of this Section.

2.05 BOXES AND TRIM

A. Boxes shall be at least 20 inches wide made from code gage galvanized sheet steel.

    a. Provide minimum gutter space according to NEC.

    b. Where feeder cables supplying the mains of a panel are carried through its box to supply other electrical equipment, the box shall be sized to include the additional required wiring space.

    c. At least 4 interior mounting studs with adjustable nuts shall be provided.

B. Switching device handles shall be accessible.

    a. Doors and panelboard trims shall not uncover any live parts.

b. Doors shall have flush chrome plated handle with cylinder lock and catch, except doors over 48 inches in height shall have auxiliary fasteners top and bottom of door in addition to the flush type cylinder lock and catch.

c. Panelboard switching devices with individual dead front doors shall be acceptable instead of standard door in trim design.

d. Panelboard trim clamps shall be of the indicating type.

C. Door hinges shall be concealed. Locks shall be keyed alike. Furnish directory frame and card having a transparent cover with each door.

D. Exterior and interior steel surfaces of the trim shall be properly cleaned, primed with rust inhibiting phosphatic coating, and finished with manufacturer's standard gray paint.

a. Trims for flush panels shall overlap the box for at least 3/4" all around.

b. Surface trims shall have the same width and height as the box.

c. Trims shall be mountable by a screwdriver without the need for special tools.

d. After installation, trim clamps shall not be accessible when the panel door is closed and locked.

E. Panelboards exposed to the weather shall have NEMA type 3R raintight enclosure or NEMA 4X in corrosive environments, per Section 1.6.C of this Section.

2.06 ELECTRICAL COMPONENTS

A. Main bus bars shall be copper sized according to UL standards to limit the temperature rise on any current carrying part to a maximum of 50 degrees C above an ambient of 40 degrees C maximum. Provide main circuit breakers, main lugs, or sub-feed lugs as required.

B. Each panelboard shall incorporate breakers with an AIC rating equal to or higher, at the application voltage, than the available fault current at its location along the electrical distribution system, as established by the fault current study required by Section 1.5 of this Section.

C. Panels tested and listed according to UL 67 and bearing an integrated short circuit rating shall be determined by the short circuit study on the electrical system, with 10,000 A minimum AIC, except that panelboards located where the fault current study indicates a higher available fault current shall be rated no lower than that calculated value.

D. Any 2 single pole circuit breakers shall be replaceable by 1 two-pole circuit breaker and any 3 single-pole breakers shall be replaceable by 1 three-pole circuit breaker.

E. Where new circuit breakers are specified to be installed within existing panelboards, they shall be compatible in terms of manufacturer, type, and AIC.

F. Distribution panelboards, 400 amperes and over, shall be provided with molded case circuit breakers tested and UL labeled according to UL 489.

G. Breakers 100 ampere through 400 ampere frame sizes shall be thermal-magnetic trip with inverse time current characteristics, unless otherwise noted, except that electronic trip units shall be provided where required for zone-selective interlocking or ground fault protection coordination.

H. Provide ground fault circuit interrupter circuit breakers where indicated.

I. Ground Fault Protection: Feeder circuit breakers serving patient care areas shall include ground fault protection per NEC 517.17, coordinated in a selective, time-graded scheme with the upstream main breaker ground fault protection specified in Section 16600, to prevent loss of an entire bus on a downstream ground fault.

2.07 DRY-TYPE STEP-DOWN TRANSFORMERS

480-120/208 V, dry-type, copper-wound, K-rated step-down transformers, sized for the connected 120/208 V panelboard load plus the minimum 10% spare capacity required by Section 1.6.B of this Section, serving each 208Y/120 V branch circuit panelboard throughout the facility.

2.08 SURGE PROTECTIVE DEVICES (SPDS)

UL 1449 listed Type 2 surge protective devices shall be provided at each distribution panelboard and at each dry-type step-down transformer secondary serving sensitive electronic and medical equipment, coordinated with the Type 1 SPDs at the main service entrance incoming terminals of the double-ended substation secondary switchgear (Section 16600) and the SPDs at each ATS downstream bus (Section 16700), forming a coordinated cascaded surge protection scheme.

2.09 OPERATING ROOM ISOLATED POWER PANELS (IPPS) AND LINE ISOLATION MONITORS

A. Each of the five (5) Trauma Operating Rooms shall be served by two (2) dedicated Isolated Power Panels (IPPs) per NFPA 99 and NEC 517.160 - one fed from the Optional Standby (Non-Essential) branch and one fed from the Critical Branch - providing an ungrounded power supply for patient care equipment within the OR.

B. Each IPP shall include its own isolation transformer, 120/208 V with an ungrounded secondary and copper windings, sized for the connected OR equipment and receptacle load.

C. Each IPP shall include its own Line Isolation Monitor (LIM) providing continuous ground fault/hazard current monitoring, with a remote hazard current indicator and audible/visual alarm mounted at the OR entrance.

D. The branch circuit panelboard fed from each IPP's isolation transformer shall serve the OR receptacles and equipment assigned to that branch, coordinated with the isolated power system receptacles specified in Section 16140.

E. The Optional Standby IPP and Critical Branch IPP in each OR shall be physically and electrically separated from each other and from all other panelboards, per NEC 700.10 and NFPA 99, and clearly labeled by source branch.

2.10 IDENTIFICATION

Panelboards labeled per Section 16100 identification requirements, including arc-flash incident energy, flash protection boundary, and required PPE labeling per NFPA 70E/IEEE 1584, and "OPTIONAL STANDBY - NON-ESSENTIAL" labeling on all Optional Standby panelboards, feeders, and disconnects per NEC 700.10 and NFPA 99.

PART 3 - EXECUTION

3.01 EXAMINATION

Do not proceed with the work of this section until conditions detrimental to the proper and timely completion of the work have been corrected in an acceptable manner. Verify electrical room space, clearances, and housekeeping pads are complete, and that upstream feeders from the double-ended substation and automatic transfer switches (Sections 16600 and 16700) are terminated and coordinated, before setting panelboards.

3.02 INSTALLATION

A. Install according to manufacturer's recommendations and applicable codes and regulations.

B. Panelboards shall be installed where indicated and with top of cabinet 6'-6" above floor, and shall be rigidly and securely attached to building construction and shall not depend upon conduit for support. Allow at least 1/2" air space behind wall mounted panelboards.

C. Install panelboards according to manufacturer's recommended data. Maintain clearances required by the National Electrical Code, with particular attention to working space around panelboards. Maintain clear space above panelboards, coordinate with other trades to avoid placement of panelboards below piping, ductwork, or other foreign appurtenances. Relocate panels at no additional cost should such interferences occur.

D. Supply panelboards with phenolic nameplate 1 inch x 3 inch on exterior of panels and engraved with panel designation and voltage rating. Lighting and power panelboards shall be provided with a clear plastic enclosed typewritten directory inside. Circuit identification shall include load type (lighting, receptacles, etc.) and rooms served.

E. Where flush type panelboards are indicated, provide one 3/4" empty conduit terminated in accessible ceiling above for each 3 spare circuit breakers provided in the panelboard.

F. Install circuit breakers in existing panelboards according to manufacturer's recommendation. Verify tightness of connections including mains. Identify new circuits on the panel directory. If none exists, provide one.

G. Maintain physical and electrical separation between Essential (Life Safety, Critical, Equipment System) and Optional (non-essential) panelboards, feeders, and branch circuits per NEC 700.10 and NFPA 99, including separate raceways and clear labeling.

3.03 FIELD QUALITY CONTROL

A. Torque all bus and breaker connections per manufacturer's specifications; verify tightness of all connections including mains.

B. Perform insulation resistance testing on all panelboards prior to energization.

C. Confirm each panelboard's installed AIC rating meets or exceeds the available fault current at its location as determined by the fault current study; verify and record final circuit directories at each panelboard.

D. Verify arc flash hazard labels are installed on all panelboards prior to energization per NFPA 70E.

E. Functionally test each Operating Room IPP and LIM for correct hazard current alarm operation prior to Substantial Completion.

3.04 CLEANING

Clean and touch up panelboards as required at completion of the project.

END OF SECTION 16470

SECTION 16511 LIGHTING FIXTURES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Interior lighting fixtures (luminaires), emergency and exit lighting units, exterior and site lighting fixtures, and heliport lighting fixtures throughout the Project.

B. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods.
2. Section 16112 - Raceways and Conduits.
3. Section 16120 - Wire and Cable.
4. Section 16140 - Wiring Devices.

1.02 REFERENCES

Underwriters Laboratories (UL) and ETL listings; IES Lighting Handbook and IES RP-29-20 (Lighting for Hospitals and Healthcare Facilities); FGI Guidelines for Design and Construction of Hospitals; ASHRAE 90.1 (lighting power density and automatic shutoff controls); NFPA 101 (Life Safety Code) and NEC Article 700 (emergency systems); NFPA 99 and NEC Article 517 (health care facilities essential electrical system); UL 924 (emergency lighting and power equipment); FAA Advisory Circular AC 150/5390-2 (Heliport Design); ASCE 7 and the Puerto Rico Building Code (PRBC) for wind load design.

1.03 SYSTEM DESCRIPTION

A. Performance Requirements: Materials shall bear Underwriters Laboratories (UL) or ETL labels.

B. The interior lighting system shall be designed to meet the illuminance levels, color rendering, and controllability requirements of the IES Handbook, IES RP-29-20, and the FGI Guidelines, while complying with the lighting power density (LPD) limits of ASHRAE 90.1.

1.04 SUBMITTALS

A. Submit manufacturer's literature and technical data before starting work.

B. Furnish certified photometric data for each fixture type in the lighting fixture schedule.

C. Upon request, a sample of each fixture proposed for use and specified unit shall be submitted to the Owner's engineer for review.

D. Provide lighting calculations demonstrating compliance with IES minimum footcandle levels when required by the Owner's engineer.

E. Point-by-point photometric calculations for the Trauma Operating Rooms, ICU rooms, Trauma Stabilization cubicles, the ambulance entrance, and the heliport, demonstrating compliance with Article 1.6, Table 1.

F. FAA-compliance documentation for all heliport lighting fixtures.

1.05 QUALITY ASSURANCE

All luminaires shall be UL or ETL listed for the intended location (damp, wet, or hazardous, as applicable). Emergency lighting units and exit signs shall be listed per UL 924. Heliport lighting fixtures shall be FAA-compliant per AC 150/5390-2.

1.06 DESIGN REQUIREMENTS

A. Illuminance Criteria: Interior spaces shall be illuminated to at least the target illuminance levels in Table 1, consistent with IES RP-29-20 and the FGI Guidelines referenced in the Bridging Document, Section 8.1. The minimum 1 fc means-of-egress level and the 30 fc ambulance entrance level are explicit Bridging Document requirements (Sections 8.2 and 8.3, respectively); the remaining space-type values reflect the IES RP-29-20 / FGI criteria that the Bridging Document directs the design to satisfy and shall be verified against final point-by-point calculations.

Space Type	Target Illuminance	Notes
Trauma OR - General (at floor)	200fc (2,000 lux)	Dimmable; separate surgical field lighting furnished by Owner as medical equipment
Trauma OR - Surgical Field		Owner-furnished surgical lights; power and supports by D&B Contractor
Trauma ICU - Patient Area	30 fc (300 lux)	Dimmable; night mode ≤ 1 fc
Trauma Stabilization Cubicle	50 fc (500 lux)	Task lighting; dimmable
Imaging - CT / X-Ray Room	30-50 fc	Dimming required during imaging procedures
Patient Room - General	20 fc (200 lux)	Dimmable; exam mode ≥ 50 fc; night mode ≤ 1 fc
Nursing Station	50 fc (500 lux)	At counter height; supplemental task lighting
Administrative / Offices	35-50 fc (350-500 lux)	Per ASHRAE 90.1 zone control
Corridors - Clinical	10-30 fc	Minimum 10 fc maintained; night mode available
Mechanical / Electrical Rooms	30 fc (300 lux)	Industrial/utility luminaires
Stairways	10 fc (100 lux)	Essential branch; emergency backup
Cafeteria / Lobby	30-50 fc (300-500 lux)	Decorative/architectural lighting by D&B

Means of Egress (corridors, stairs, exterior exits)	1 fc minimum	Per Bridging Document Section 8.2; NFPA 101 / NEC Article 700
Ambulance Entrance / Trauma Bay / ED Entrance	≥ 30 fc	Per Bridging Document Section 8.3; Essential Electrical System powered

Table 1 - Interior Illuminance Criteria

B. Lighting power density (LPD) for all interior spaces shall comply with ASHRAE 90.1 Table 9.6.1 (Space-by-Space Method); automatic shutoff controls shall comply with ASHRAE 90.1 Section 9.4.1.

C. All exterior luminaires shall be IP65 rated, with hurricane-rated mounting per ASCE 7/PRBC (180 mph design wind speed), and corrosion-resistant (marine-grade aluminum or stainless steel) housings, per Section 16100.

PART 2 - PRODUCTS

2.01 EQUIPMENT

A. Lighting Fixtures:

1. Provide LED luminaires. Fixtures shall be fabricated from heavy-gauge steel, aluminum, or stainless steel as specified, with antimicrobial powder coat finish where applicable. Provide LED modules with a minimum efficacy of 120 lm/W, 0-10V dimming drivers, universal 120/277V input, and a minimum L70 life of 50,000 hours.
2. The schedule and details of lighting fixtures appearing on the drawings indicate the type, construction, appearance, quality, and performance of the fixtures required.
    a. Manufacturers: New Star Lighting, Current Lighting, or other Owner-approved equal. An alternate manufacturer may be submitted provided the submittal is accompanied by complete technical documentation demonstrating compliance with all specification requirements.
    b. Proposed substitute lighting fixtures will be judged on overall quality of construction.
    c. Provide a 120V working sample of proposed substitution with cord, plug, and lamp.
3. Materials used in the manufacture of fixtures shall be new and the best of their respective kind, and shall be formed and assembled in a neat, accurate, and professional manner.
    a. Sheet metal shall be of sufficient thickness, or shall be ribbed, flanged, or otherwise reinforced, so that lighting fixtures and their component parts will withstand the stresses of normal handling, installation, and service without undue distortion of shape.

b. Plastering or other installation procedures shall not be relied on to reinforce lighting fixtures or their component parts.

c. Fixture bases shall be metal and fastened to the mounting location with metal components.

4. Fixtures shall be complete with canopies, suspensions of proper lengths, hickeys, casing, sockets, holders, reflectors, hardware, and shall be completely wired and assembled. Each troffer shall have a minimum of 2 earthquake clips, positive enclosed spring-loaded catches, and safety hinges.
5. Exposed fixture housings or frames shall have a continuous, smooth surface with no visible seams and a neat, finished appearance. Hinges and fastening devices shall be fully concealed except with special permission of the Owner's engineer.
6. Where fixture type is not indicated on drawings, the fixture type used in similar locations shall be provided, as accepted by the Owner's engineer.
7. Components of the same type, size, rating, and functional characteristics, and of the same make, of similar interior lighting fixtures shall be interchangeable.
8. Fixture stems shall be furnished by the manufacturer of the fixture specified or as shown on the drawings.
9. Fixtures for use outdoors or in wet areas shall be suitably gasketed to prevent access of moisture or insects into the fixture or diffuser.
10. Metal parts of fixtures for use in damp locations, specified as requiring painting, shall be painted with suitable weather- and moisture-resistant paints exhibiting moisture-resisting qualities equal to epoxy-based coatings.
11. Aluminum parts of fixtures for use in damp locations specified as requiring an unpainted finish shall be anodized.
12. Warranty: 5 years.

2.02 LIGHT SOURCE AND COLOR QUALITY

LED light sources shall be used throughout the facility. High Color Rendering Index (CRI ≥ 90) is required in all patient care areas; a minimum CRI of 80 is acceptable in non-patient-care support spaces. Tunable white LED (correlated color temperature adjustable from 2,700 K to 6,500 K) shall be provided in the Trauma Operating Rooms, ICU rooms, and Trauma Stabilization areas for clinical task accuracy.

2.03 LUMINAIRE TYPES BY APPLICATION

A. Administrative and support spaces: recessed lay-in luminaires.

B. Corridors: recessed luminaires.

C. Patient rooms and patient care areas: sealed luminaires with a flat, wipe-down surface for infection control and ease of cleaning.

D. Public spaces: recessed or surface-mounted decorative/architectural luminaires as coordinated with the architectural design intent.

E. Mechanical and electrical rooms: vapor-tight luminaires. Where fan rooms are used as an air plenum, provide suitably gasketed vapor-tight lighting fixtures.

F. Surgical suites and trauma rooms: IP65-rated sealed luminaires suitable for washdown and infection-control cleaning protocols.

2.04 EMERGENCY AND EXIT LIGHTING

A. Exit Signs: LED combination illuminated exit signs with a 90-minute minimum battery backup per UL 924, illuminated from the Life Safety Branch or an integral battery per NEC Article 700.

B. Battery Unit Equipment: Emergency lighting units with integral sealed batteries (90-minute rating), UL 924 listed, may supplement Life Safety Branch circuits in areas where circuit routing is impractical.

C. Patient Care Area Emergency Task Lighting: Emergency task lighting in the Trauma Operating Rooms, ICU, and Trauma Stabilization areas shall be powered from the Essential Electrical System Critical Branch - not from battery units - to ensure continuous, full-illuminance task lighting during extended outages, per NFPA 99 / NEC Article 517.

D. Egress Lighting: Minimum 1 fc maintained on all means-of-egress paths (exit stairways, corridors, lobbies, and exterior exits) per NFPA 101 and NEC Article 700.

2.05 EXTERIOR AND SITE LIGHTING

A. Site and service parking area lighting: LED pole-mounted area lights on photocell-plus-time-clock control.

B. Building façade / architectural lighting: coordinated with the architectural design intent.

C. Ambulance Entrance: High-illuminance area lighting (≥ 30 fc) at the ambulance drop-off, trauma bay entrance, and emergency department entrance; powered from the Essential Electrical System.

D. All exterior luminaires shall be IP65 rated, hurricane-rated per ASCE 7/PRBC (180 mph design wind speed), and constructed of corrosion-resistant marine-grade aluminum or stainless steel for Puerto Rico's coastal/marine climate, per Article 1.6.C.

2.06 HELIPORT LIGHTING FIXTURES

A. Perimeter Lights: FAA-compliant flush-mounted or low-profile omnidirectional white/yellow lights at the perimeter of the Final Approach and Takeoff (FATO) area; spacing and photometric output per AC 150/5390-2.

B. Touchdown/Liftoff (TLOF) Area Lights: FAA-compliant TLOF edge or in-pavement lights, white/green, around the landing pad.

C. Windsock / Wind Indicator: Lighted windsock on an FAA-approved support structure at the heliport level, illuminated at night from the Essential Electrical System.

D. Obstacle/Obstruction Lighting: FAA-required red obstruction lights on any rooftop mechanical equipment, structures, or antenna masts penetrating the FAA-defined heliport obstacle clearance surface.

E. Flood Lighting: Supplemental flood/area lighting of the heliport pad and access path for night operations.

All heliport lighting shall be powered from the Essential Electrical System Critical Branch, as power continuity is required for night-time and instrument flight rule (IFR) medevac operations.

PART 3 - EXECUTION

3.01 INSPECTION

A. Do not proceed with the work of this Section until conditions detrimental to the proper and timely completion of the work have been corrected in an acceptable manner.

B. Verify ceiling type, mounting substrate, and reflected ceiling plan coordination before installing luminaires.

3.02 INSTALLATION

A. Install fixtures according to manufacturer's recommendations and the reflected ceiling plan; support independently of the ceiling grid where required by seismic criteria.

B. Install "lay-in" type fixtures with 6-foot lengths of flexible conduit to enable fixture relocation with minimum inconvenience. Fixture shall be securely fastened to ceiling frame members by mechanical means as per the NEC.

C. Exit lights:

1. Install wall- or ceiling-mounted as shown on drawings.
2. Provide directional arrows required to show correct path to exit.
3. Install exit lights at a location and height to assure a clear line of sight from the egress passageway.
4. Relocate exit lights that are not readily visible at no additional cost to the Owner.
5. Internally illuminated exit signs shall have an LED light source.

D. Fixture Supports:

1. Support each fixture securely.
2. Each recessed LED troffer shall be lay-in supported by the ceiling suspension system. Provide at least 2 earthquake clips.
3. Where pendant fixtures are mounted in continuous rows, the number of hangers shall equal the number of 4-foot lengths, plus 1.
4. Do not support fixtures from plaster or gypsum board ceilings.
5. Furnish and install steel members and supports to fasten and suspend fixtures.

E. Install lighting fixtures on ceilings or walls of mechanical and electrical equipment rooms after piping, ductwork, and equipment are installed therein.

1. Exact location and switching for such fixtures will be determined at the job site during the work.
2. Fixtures shall be located to give maximum illumination to items of equipment requiring servicing and moving machinery.
3. Any lighting fixtures blocked, inaccessible, or improperly located shall be relocated at no extra cost.
4. Where fan rooms are used as an air plenum, provide suitable gasketed vapor-tight lighting fixtures.

F. Heliport Lighting Controls: Heliport lighting shall be controlled from the Disaster Control Center (Level 9) and from a local control panel at the heliport level; pilot-activated lighting (PAL) radio control may be considered.

3.03 FIELD QUALITY CONTROL

A. Perform point-by-point illuminance verification in the Trauma Operating Rooms, ICU rooms, Trauma Stabilization cubicles, the ambulance entrance, and the heliport, confirming compliance with Table 1 and FAA requirements.

B. Verify 90-minute battery operation of all exit signs and battery emergency lighting units per UL 924 testing requirements.

END OF SECTION 16511

SECTION 16550 38 KV POWER TRANSFORMERS

PART 1 - GENERAL

1.01 SUMMARY

A. This Section specifies the furnishing, delivery, installation, testing, and commissioning of two (2) less-flammable liquid-filled, outdoor power distribution transformers rated 38 kV primary / 13.2 kV secondary, 3,750 kVA each, for the outdoor yard-type substation serving the Puerto Rico Trauma Hospital at Centro Médico, San Juan, Puerto Rico.

B. Each transformer shall be a self-contained, outdoor-rated unit capable of independent operation and shall provide full N+1 redundancy: either transformer alone shall be capable of carrying the complete facility electrical load.

C. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16112 - Raceways and Conduits (underground duct banks and manholes for the 13.2 kV feeders from this substation yard to the Building Basement double-ended substation)
3. Section 16600 - Double-Ended Substation (downstream indoor building substation receiving the 13.2 kV feeders originating at this yard-type substation)

1.02 APPLICABLE CODES AND STANDARDS

All transformers and associated equipment shall be designed, manufactured, and tested in accordance with the latest editions of the following codes and standards. Where conflicts exist, the most stringent requirement shall govern.

A. IEEE/ANSI Standards:

1. IEEE C57.12.00 - IEEE Standard for Liquid-Immersed Distribution, Power, and Regulating Transformers - General Requirements
2. IEEE C57.12.10 - IEEE Standard Requirements for Liquid-Immersed Power Transformers
3. IEEE C57.12.34 - IEEE Standard Requirements for Pad-Mounted, Compartmental-Type, Self-Cooled, Three-Phase Distribution Transformers
4. IEEE C57.12.90 - IEEE Standard Test Code for Liquid-Immersed Distribution, Power, and Regulating Transformers
5. IEEE C57.91 - IEEE Guide for Loading Mineral-Oil-Immersed Transformers (applied herein to less-flammable liquid-immersed units)

6. IEEE C57.110 - IEEE Recommended Practice for Establishing Transformer Capability When Supplying Nonsinusoidal Load Currents
7. IEEE 1246 - IEEE Guide for Temporary Protective Grounding Systems Used in Substations
8. IEEE 80 - IEEE Guide for Safety in AC Substation Grounding

B. NEMA/UL Standards:

1. NEMA TR 1 - Transformers, Regulators, and Reactors
2. UL Listed or tested equivalent certification for less-flammable liquid-type transformers
3. UL 2107 - Standard for Less-Flammable Liquids for Use in Electrical Apparatus

C. Federal, Local, and Utility Standards:

1. NFPA 70 - National Electrical Code (NEC), latest edition adopted in Puerto Rico; Articles 230, 240, 250, 450
2. NEC Article 450.23 - Less-Flammable Liquid-Insulated Transformers (outdoor installation)
3. NFPA 99 - Health Care Facilities Code - Essential Electrical System requirements
4. NFPA 70E - Electrical Safety in the Workplace
5. U.S. Department of Energy (DOE) - Energy Efficiency Standards for Distribution Transformers (10 CFR Part 431)
6. Puerto Rico Building Code (PRBC) - incorporating the 2018 International Building Code (IBC) with Puerto Rico amendments
7. PREPA/LUMA Energy - Reglamento Complementario al Código Eléctrico Nacional; Standards TM-13-2 and TM-13-3
8. NESC (National Electrical Safety Code) - minimum safety clearances
9. PREPA Comunicado 0-2-06 - substation safety clearance requirements

1.03 SUBMITTALS

A. Shop Drawings and Product Data:

1. Complete transformer nameplate schedule confirming all rated characteristics, BIL levels, cooling mode ratings, and efficiency data
2. Dimensioned outline drawing and installation footprint, including lifting provisions, weights (shipping, installed, fluid only), tank dimensions, and clearance requirements

3. Schematic and connection diagram, including winding configuration, tap changer positions, and accessory wiring diagram
4. Bushing arrangement drawing, confirming HV top-entry and LV bottom-entry cabinet configuration
5. Spill containment basin sizing calculation confirming 110% of insulating liquid volume
6. Seismic and wind anchorage calculations for the specified design loads (Category 5 hurricane, 180 mph; Puerto Rico Building Code seismic)
7. Insulating liquid safety data sheet (SDS), flash point certification, and UL listing documentation confirming classification as less-flammable liquid per NEC 450.23 and UL 2107
8. Cooling fan control wiring diagram and automatic KNAN/KNAF switching logic
9. Accessory list confirming all specified accessories (Article 2.8, Items A through J)
10. LUMA-endorsed drawings for the utility interconnection (aerial point of connection, pole risers, underground feeder, GOAB switch, and substation), obtained prior to commencing site work, per Section 16100, Section 1.5.B.2.

B. Test Reports - Factory and Field:

1. Factory certified test reports per IEEE C57.12.90, including: ratio, polarity, phase relation; no-load losses and excitation current; load losses and impedance voltage; dielectric withstand (applied voltage, induced voltage, BIL impulse); sound level; insulating liquid dielectric strength
2. DOE efficiency certification
3. Field acceptance test report (see Part 3)

C. Operation and Maintenance (O&M) Manuals - submit prior to energization:

1. Complete transformer O&M manual including energization procedures, maintenance schedules, and troubleshooting guide
2. Insulating liquid testing procedures and test frequency schedule
3. Parts list with recommended spare parts

1.04 QUALITY ASSURANCE

A. Manufacturer's Experience: Transformer manufacturer shall have a minimum of ten (10) consecutive years of experience manufacturing liquid-filled power transformers in the specified voltage and kVA class.

B. Factory Testing: All transformers shall undergo and pass the complete routine test program per IEEE C57.12.90 prior to shipment. Test reports shall be provided before delivery is accepted.

C. DOE Efficiency: Each transformer shall comply with the U.S. Department of Energy energy efficiency standards (10 CFR Part 431) applicable to the transformer's rated voltage and kVA.

D. Source Limitations: The transformers specified herein - both units - shall be furnished by the same manufacturer to ensure interchangeability of parts, accessories, and spare components.

E. LUMA Coordination: The D&B Contractor shall meet with LUMA at project start to confirm the aerial point of connection, pole riser locations, GOAB switch location and rating, metering requirements, and the interconnection agreement. LUMA approval of the 38 kV service connection and substation design is required before construction and prior to energization. The D&B Contractor shall initiate the LUMA interconnection process immediately upon contract award and shall not allow LUMA approval to become the critical path.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Factory Shipping: Transformers shall be shipped filled with insulating liquid unless the manufacturer's standard practice requires otherwise, in which case the transformer shall be shipped dry under positive pressure of dry nitrogen and the insulating liquid shall be shipped separately in sealed containers.

B. Inspection Upon Delivery: The Contractor shall inspect each transformer immediately upon receipt and report any damage to the transformer and to the shipping carrier within 24 hours. Do not energize a transformer that has sustained physical damage without written authorization from the manufacturer.

C. Storage: Store transformers indoors or under cover, protected from weather, moisture, and construction debris. Maintain nitrogen pressure on units shipped dry. Store insulating liquid in sealed, clean containers per manufacturer's recommendations.

D. Handling: Lift transformers only using lifting eyes or lugs provided by the manufacturer. Do not lift by tank accessories, fittings, or bushings. Comply with manufacturer's handling and tilt limitations.

E. Service Access: The substation yard layout shall provide a service road or paved access for delivery and future replacement of either transformer without disturbing the other transformer or the 15 kV primary switchgear. Coordinate with the Structural Engineer of Record for equipment pad and access road design.

1.06 WARRANTY

A. Provide manufacturer's standard warranty against defects in materials and workmanship for a minimum of five (5) years from the date of energization or six (6) years from the date of shipment, whichever occurs first.

B. The warranty shall include repair or replacement of failed components, including insulating liquid if loss results from a warranty-covered defect.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, provide transformers from one of the following manufacturers. No substitutions without prior written Owner approval:

1. ABB (Hitachi Energy) - PowerTransformer or Distribution Transformer product line
2. Eaton Corporation - Copper Power / Cooper Transformer product line
3. General Electric (GE Industrial Solutions) - Power Transformer line

B. Approved Equal: An alternate manufacturer may be submitted for Owner and Engineer review, provided the submittal is accompanied by complete technical documentation demonstrating compliance with all specification requirements.

2.02 TRANSFORMER RATINGS

A. Provide two (2) power distribution transformers, identical and interchangeable, with the following minimum ratings:

1. Rated kVA: 3,750 kVA per unit (7,500 kVA total N+1 firm capacity)
2. Phases/Frequency: Three-phase (3Ø), 60 Hz
3. Primary Voltage (HV): 38 kV, Delta connection
4. Secondary Voltage (LV): 13.2 kV, three-phase, grounded wye (13,200Y/7,620 V)
5. Voltage Ratio: 38,000Δ / 13,200Y V
6. BIL - Primary (HV): 250 kV (per ANSI/IEEE C57.12.00 for the 38 kV class)
7. BIL - Secondary (LV): Per IEEE C57.12.00 for the 15 kV voltage class
8. Temperature Rise (Winding): 55°C / 65°C dual-rated
9. Insulation Class: 65°C insulation system
10. Cooling Mode: KNAN (self-cooled) / KNAF (fan-cooled)
11. Rated Impedance: 5.75% nominal at base kVA (confirm with manufacturer for fault coordination)
12. Winding Material: Copper (both HV and LV windings)
13. Insulating Medium: Less-flammable liquid per NEC 450.23 and UL 2107
14. Sound Level: Maximum 68 dB(A) at rated load, fans off (self-cooled mode); per NEMA TR 1 and IEEE C57.12.90

15. Service Environment: Outdoor, tropical coastal - Puerto Rico (San Juan); NEMA 3R, stainless steel enclosure
16. Seismic Design: Puerto Rico Building Code - seismic design per site-specific requirements
17. Design Wind Speed: Category 5 hurricane - 180 mph design wind speed

B. The D&B Contractor shall confirm, via complete facility load calculation, that 3,750 kVA per unit is adequate for all facility loads plus a minimum 10% spare capacity for future growth, including all future surge capacity loads. If the load calculation demonstrates that a larger transformer is required, the larger unit shall be provided without additional cost to the Owner.

2.03 ELECTRICAL CHARACTERISTICS

A. Winding Configuration:

1. Primary (HV) winding: Delta (Δ) - 38 kV class; ungrounded delta connection
2. Secondary (LV) winding: Grounded wye (Y) - 13.2 kV; solidly grounded neutral; neutral terminal brought out for connection to the system ground grid
3. Vector group: Standard Dyn (Delta primary / Wye secondary with neutral)
4. Winding conductors: Copper for all windings; no aluminum windings

B. Impedance:

1. Nominal impedance: 5.75% at rated frequency and rated kVA
2. Impedance shall be confirmed by the manufacturer with certified test report; impedance shall not exceed 6.50% without Owner's Engineer approval
3. Impedance tolerance: ±7.5% of nameplate impedance per IEEE C57.12.00
4. The D&B Contractor shall perform a complete fault current study at the 13.2 kV primary bus and 480 V secondary bus to verify that the transformer impedance and fault contribution are within the interrupting ratings of downstream protective devices

C. Efficiency:

1. Each transformer shall comply with DOE minimum energy efficiency standards (10 CFR Part 431) for liquid-filled distribution transformers
2. Submit certified efficiency test data per IEEE C57.12.90

2.04 TAP CHANGER

A. De-Energized Tap Changer (DETC):

1. Type: De-energized tap changer (DETC) - manual operation with transformer de-energized and isolated
2. Location: Primary (HV) winding - 38 kV side

3. Range: Four (4) tap positions at 2½% steps, providing +5%, +2½%, Nominal, -2½%, -5% of rated primary voltage
4. Operation: External handle or bolted position selector; position indicator clearly visible from ground level
5. Purpose: Voltage adjustment to compensate for LUMA delivery voltage variation at the 38 kV service point; coordinate tap settings with LUMA's voltage regulation at the point of connection

NOTE: DETC operation requires the transformer to be fully de-energized and isolated per NEC 450.26 and NFPA 70E safe work practices before changing tap position. Provide locking provisions and a warning label on the DETC mechanism.

2.05 BUSHING ARRANGEMENT

A. High-Voltage (HV) Bushings - Primary, 38 kV:
   1. Configuration: Top-entry (top-mounted) bushings on tank cover - three (3) single-phase HV bushings
   2. Voltage class: 38 kV (46 kV-class bushings per ANSI standard)
   3. BIL: 250 kV minimum
   4. Material: Oil-impregnated paper condenser or porcelain - suitable for tropical coastal environment; corrosion-resistant hardware
   5. Connection: Suitable for connection to the 46 kV-class primary fuse assembly on the 38 kV aluminum structure (Article 2.12); terminals sized for the primary cable/conductor as determined by the D&B Contractor's fault current study

B. Low-Voltage (LV) Bushings - Secondary, 13.2 kV:
   1. Configuration: Bottom-entry from an integral LV terminal cabinet; three (3) phase bushings plus neutral bushing
   2. Terminal cabinet: Integral padlockable LV terminal cabinet on the transformer tank for bottom-entry cable connection to the 15 kV primary switchgear (Article 2.13)
   3. Voltage class: 15 kV-class bushings (25 kV BIL minimum)
   4. Neutral terminal: Neutral bushing brought to exterior of tank for system ground connection
   5. Connection: Suitable for 15 kV-class shielded power cable connections from primary switchgear incoming feeders

2.06 COOLING SYSTEM

A. Cooling Mode Ratings (KNAN/KNAF):
   1. KNAN (natural convection - self-cooled): Transformer shall achieve rated 3,750 kVA at 55°C temperature rise with no forced cooling (all fans off)

2. KNAF (forced air - fan-cooled): Transformer shall achieve rated 3,750 kVA at 65°C temperature rise with forced air cooling fans operating

NOTE: KNAN/KNAF cooling designations apply to less-flammable (non-mineral-oil) liquid-filled units. The equivalent for mineral-oil units would be ONAN/ONAF. Verify the manufacturer's cooling mode designation conforms to IEC 60076-2 / IEEE C57.12.00 as applicable.

B. Forced Air Cooling Fans:

1. Forced air fans and complete factory-installed fan control package shall be provided (Article 2.8, Item G)
2. Fans shall activate automatically based on oil temperature and/or load current, per manufacturer's standard control logic; manual override controls shall also be provided
3. Fan motors and controls: Suitable for the outdoor tropical environment; thermally protected fan motors; NEMA 3R stainless steel enclosures
4. Control power: 120 V AC, single-phase, 60 Hz, derived from the 15 kV primary switchgear control power PT/panelboard (Article 2.13); an automatic transfer switch provided at the substation auxiliary panelboard ensures continuous control power availability

2.07 TANK AND ENCLOSURE

A. Tank Construction:

1. Material: Stainless steel tank construction required; heavy-gauge steel with corrosion-resistant coating is not acceptable for this tropical coastal environment
2. All exposed hardware, bolts, fasteners, and fittings: Stainless steel or equivalent corrosion-resistant material
3. Corrosion protection: Full corrosion-resistant treatment and coating system suitable for the Puerto Rico coastal/tropical environment; minimum paint system per IEEE C57.12.00
4. Tank design: Sealed, corrugated, or smooth-wall tank with thermally compensating provision; tank shall be leak-tested at factory
5. Lifting provisions: Four (4) lifting eyes integral to tank cover, rated for full transformer lifting weight
6. Tiedown/anchoring provisions: Tank base with anchoring holes or pads for seismic and hurricane anchorage to the concrete equipment pad

B. Insulating Liquid:

1. Type: Less-flammable liquid insulated - fire point greater than 300°C per ASTM D92 (or as classified per NEC 450.23); acceptable products include MIDEL

7131, BIOTEMP, Envirotemp FR3, or approved equal that qualifies as less-flammable per NEC 450.23 and is listed per UL 2107

2. The insulating liquid shall be compatible with all internal transformer materials (windings, insulation, gaskets)
3. The insulating liquid shall be provided factory-filled at rated level; no on-site filling of liquid required
4. SDS and certification of flash point/fire point shall be submitted with shop drawings

C. Outdoor Enclosure Rating:

1. Enclosure rating: NEMA 3R, stainless steel construction for all external accessories, junction boxes, and terminal compartments
2. Transformer shall be designed and rated for continuous outdoor operation in a tropical coastal environment (high humidity, salt air, ambient temperature range 20°C to 45°C)
3. No supplementary weather protection structure is required; transformer shall be fully self-protected for the specified outdoor environment

2.08 ACCESSORIES AND INSTRUMENTATION

A. Each transformer shall be furnished complete with all of the following accessories, factory-installed and wired:

1. Item A - De-Energized Tap Changer (DETC): HV primary tap adjustment; four (4) 2½% taps above and below nominal 38 kV; external operator; position indicator
2. Item B - Liquid Level Gauge: Indicates insulating liquid level in tank; dial or column gauge mounted on tank wall; with auxiliary contact (Item J)
3. Item C - Dial-Type Thermometer: Indicates top-oil temperature; dial gauge with red maximum-temperature indicator pointer; graduated in °C; range suitable for operating and alarm temperatures
4. Item D - Pressure/Vacuum Gauge: Indicates gas space pressure/vacuum above insulating liquid; dial type; compound gauge reading both positive pressure and vacuum; with auxiliary contact (Item H)
5. Item E - Pressure Relief Device: Spring-loaded pressure relief valve (PRV) with integral discharge deflector directed away from personnel areas; activates at manufacturer's rated relief pressure to protect tank from rupture; with auxiliary contact (Item I)
6. Item F - Rapid Pressure Rise Relay (RPRR): Sudden/rapid pressure rise relay for internal fault detection; differential pressure sensing; trips transformer primary protection fuse or provides signal to trip/alarm; wired to substation protection/alarm panel

7. Item G - Forced Air Fans and Control Package: Factory-installed cooling fans with automatic temperature/load-based control; manual override; suitable for outdoor tropical environment; 120 V AC control power
8. Item H - Auxiliary Contact, Pressure/Vacuum Gauge: Normally open (NO) contact on the pressure/vacuum gauge (Item D) for remote alarm; wired to substation alarm panel
9. Item I - Auxiliary Contact, Pressure Relief Device: Normally open (NO) contact on the pressure relief device (Item E) for remote alarm on PRV operation; wired to substation alarm panel
10. Item J - Auxiliary Contact, Liquid Level Gauge: Normally open (NO) contact on the liquid level gauge (Item B) for remote alarm on low liquid level; wired to substation alarm panel

B. Additional Required Accessories:

1. Thermometer well: Provision for insertion of calibrated thermometer or RTD for testing and commissioning; located on tank cover or side wall
2. Drain valve with sampler: Minimum 1-inch drain valve with sampling point at base of tank for insulating liquid sampling and complete drainage; valved and plugged
3. Filter/fill valve: Provision for vacuum filling, filtering, and oil reclamation at future maintenance intervals
4. Ground pads: Minimum two (2) ground pads per transformer (one per side) for system and tank grounding connections; stainless steel or tin-plated copper
5. Nameplate: Stainless steel or anodized aluminum nameplate (Article 2.11)

2.09 SPILL CONTAINMENT

A. A reinforced concrete spill containment curb and basin shall be provided for each transformer in accordance with NEC 450.23. Design requirements:

1. Volume: Basin volume shall accommodate a minimum of 110% of the total insulating liquid volume of the transformer (largest single-unit quantity)
2. Construction: Reinforced concrete, waterproofed and liquid-tight; designed for the transformer's weight plus the contained liquid weight; coordinated with structural/civil engineer
3. Curb height: Minimum height determined by basin volume calculation; coordinate with equipment pad elevation
4. Aggregate fill: Transformer pads within the containment basin may be filled with clean crushed stone aggregate to reduce net liquid containment volume and to suppress fire in the event of liquid release; coordinate with basin sizing
5. Discharge: Basin shall drain to an oil/water separator; no insulating liquid shall reach storm drains or soil

2.10 EQUIPMENT PADS AND SEISMIC ANCHORAGE

A. Reinforced concrete equipment pads shall be provided for each transformer:

1. Pad design: Reinforced concrete pad designed by the Structural Engineer of Record (EOR) for the transformer's operating weight, shipping weight, seismic loads (Puerto Rico Building Code, site-specific seismic design), and hurricane wind loads (Category 5, 180 mph design wind speed)
2. Anchor bolts: Anchor bolt pattern per transformer manufacturer's requirements; hot-dip galvanized or stainless steel anchor bolts; transformer base anchored to pad to resist the design seismic and wind loads; calculations to be submitted with shop drawings
3. Working clearance: Pads sized to accommodate transformer footprint plus adequate working clearance on all sides per NFPA 70E and NEC 110.26
4. Housekeeping pad elevation: Pads elevated above substation yard grade to prevent water intrusion into transformer base and LV terminal cabinet

B. Hurricane and Seismic Design:

1. All transformer anchorage, the 38 kV aluminum structure, the 15 kV switchgear structure, and all other free-standing substation equipment shall be designed for the project design wind speed (180 mph, ASCE 7) and the site seismic design values
2. Transformer tank and all mounted accessories shall remain intact and liquid-tight under the design wind and seismic loads
3. Submit anchorage calculations for Owner/Engineer review at Design Development phase

2.11 NAMEPLATE

A. Provide a permanent, corrosion-resistant nameplate (stainless steel or anodized aluminum) securely attached to the transformer tank on the control/access side. Nameplate shall include, at minimum:

1. Manufacturer's name and serial number
2. Year of manufacture
3. kVA rating (KNAN/KNAF ratings)
4. Primary and secondary voltages and connections
5. Impedance at rated kVA and temperature
6. Temperature rise (55°C / 65°C)
7. BIL - primary and secondary
8. Insulating liquid type and total liquid volume (gallons/liters)
9. Winding material (Copper)

10. Cooling mode (KNAN/KNAF)
11. Weight: total (operating), core and coil assembly, tank, liquid
12. Frequency (60 Hz) and number of phases (3)
13. DOE efficiency data

2.12 38 KV ALUMINUM STRUCTURE AND PRIMARY PROTECTION

The following upstream structure and protection equipment, located within the same fenced substation yard, is furnished as part of this Section per the Bridging Document's integrated yard-type substation scope (Bridging Document Section 4.2.2) and is the connection point for the transformer HV bushings specified in Article 2.5.A.

A. Aluminum Structure: An outdoor aluminum primary support structure conforming to PREPA Standard TM-13-2 and TM-13-3 (modified for a two-transformer configuration), supporting the incoming 38 kV conductors (downstream of the GOAB switch), the lightning arresters, the incoming fuse set, metering PTs/CTs, and the 46 kV fuse assembly serving each of the two transformers. Each transformer is protected by a dedicated set of 46 kV-class fuses; the single pole-mounted GOAB switch and the 38 kV structure entrance fuse set together serve as the upstream switching and protection point for the substation.

B. Lightning Arresters: One (1) set of 36 kV-class station-type lightning arresters at the incoming 38 kV structure entrance, installed downstream of the GOAB switch and upstream of the incoming fuse set, the metering PTs/CTs, and the transformer primary fuses.

C. Incoming Fuse Set and Metering: One (1) set of 46 kV-class high-voltage power fuses at the 38 kV structure entrance, downstream of the GOAB switch and lightning arresters, and upstream of the metering PTs and CTs; this incoming fuse set is independent of the dedicated 46 kV fuse assembly serving each transformer. Metering PTs and CTs shall be located downstream of this incoming fuse set, ahead of the branch to each transformer's 46 kV fuse assembly.

D. Primary Overcurrent Protection: 46 kV-class fuses on each transformer primary (one dedicated set per transformer), sized for transformer inrush and full-load protection per LUMA requirements and the system fault current study, with protective relay coordination with LUMA's upstream protective devices.

2.13 15 KV PRIMARY SWITCHGEAR

An outdoor 15 kV-class metal-enclosed primary switchgear lineup shall be provided within the fenced substation yard to receive each transformer's 13.2 kV secondary and distribute power toward the building substation (Section 16600), per the Bridging Document (Section 4.2.3).

A. Transformer Incoming Switches: Two (2) load-break switches, one per transformer, connecting each transformer's 13.2 kV secondary (Article 2.5.B) to its respective switchgear bus section.

B. Tie Switch: One (1) normally open tie load-break switch connecting the two bus sections, allowing either transformer to serve the full substation load if the other transformer or its incoming switch is out of service, matching the N+1 philosophy of the double-ended substation (Section 16600).

C. Outgoing Feeders: Two (2) load-break switches with current-limiting fuses, one per bus section, feeding the two 13.2 kV underground feeders to the building substation (Section 16600, routed per Section 16112).

D. Control Power: Potential transformers (PTs) shall derive a 120 V control/auxiliary power supply for the transformer cooling fans and substation lighting, distributed via an automatic transfer switch and a dedicated panelboard.

E. Rating: 15 kV class, metal-enclosed, load-break switches rated for the available fault current at the 13.2 kV bus; all switches lockable/padlockable in all positions; outdoor rated with a NEMA 3R stainless steel enclosure.

2.14 SUBSTATION YARD LAYOUT AND PHYSICAL REQUIREMENTS

A. Fenced Yard: Fully enclosed with security fencing providing restricted access and a lockable gate, meeting minimum safety clearances per NESC, NEC, NFPA 70E, IEEE 1247, and PREPA Comunicado 0-2-06 from transformer enclosures, the 38 kV aluminum structure, the 15 kV primary switchgear, live parts, and fence to any accessible area.

B. All Substation Equipment Pads: Reinforced concrete equipment pads, designed to support the imposed equipment, seismic, and wind loads, shall be provided for all floor-mounted equipment - transformer pads (Article 2.10), aluminum structure foundations, 15 kV switchgear bases, protection and metering panel bases, and any other free-standing equipment within the substation yard.

C. Service Access: Service road or paved access for transformer delivery and future maintenance/replacement, positioned to allow removal of one transformer unit without disturbing the other transformer or the 15 kV primary switchgear.

D. Yard Lighting: Security and maintenance lighting powered from the 15 kV switchgear panelboard (Article 2.13.D), on automatic photocell control with manual override.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install transformers in accordance with manufacturer's instructions, this specification, NEC Articles 450 and 230, and NFPA 70E safe work practices for high-voltage equipment.

B. Energization of the transformers shall not occur until written authorization is received from the Owner's Engineer following successful completion of all factory and field tests and approval of all required submittals.

C. Personnel performing installation and initial energization shall be qualified electrical workers in accordance with NFPA 70E, with documented high-voltage (above 1,000 V) experience.

D. Equipment Pads:

1. Concrete equipment pads shall be complete, cured to full design strength, and anchor bolts installed before transformer delivery to site
2. Verify pad elevations, anchor bolt locations, and levelness before setting transformers
3. Set transformers with all four base mounting points in full contact with the pad; shim as required; torque anchor bolts to manufacturer's specification

E. Spill Containment Basin:

1. Spill containment basin, curb, and oil/water separator shall be complete before transformer installation
2. Verify basin drain is functional and oil/water separator is operational before energizing transformers

F. Primary and Secondary Connections:

1. Primary (HV) connections - 38 kV: Connect top-entry HV bushings to the 46 kV primary fuse assembly on the 38 kV aluminum structure (Article 2.12) per the approved construction drawings; all work on the 38 kV side shall be performed only after the GOAB switch is confirmed open and locked out
2. Secondary (LV) connections - 13.2 kV: Connect LV terminal cabinet bottom-entry cable to the 13.2 kV incoming load-break switch in the 15 kV primary switchgear (Article 2.13); use 15 kV-class shielded cable with properly installed and tested terminations per IEEE 48 and cable manufacturer's requirements
3. Neutral connection: Connect the transformer LV neutral bushing to the substation grounding grid

G. Control and Alarm Wiring:

1. Wire transformer cooling fan control power from the substation auxiliary panelboard; verify automatic cooling control operates correctly before energizing
2. All field-installed control wiring shall be in metallic conduit or liquid-tight conduit; minimum #14 AWG stranded copper conductors; labeled at both ends per the approved drawings

3.02 GROUNDING AND BONDING

A. Ground the transformer tank and LV neutral to the outdoor substation grounding grid in accordance with IEEE 80, IEEE 142, and NEC Article 250:

1. Transformer tank: Bond tank ground pads (minimum 2 pads per transformer) to the substation grounding grid; minimum 4/0 AWG copper bare grounding conductor
2. LV neutral: Ground the transformer secondary neutral (13.2 kV wye neutral) solidly to the substation grounding grid; conductor size per fault current study; the neutral conductor shall be run separately from the tank grounding conductor
3. LV terminal cabinet: Bond LV terminal cabinet to tank ground
4. Substation grounding grid: The outdoor substation grounding grid shall be designed per IEEE 80 for step potential and touch potential safety limits; the grid shall extend under and around the transformer pads, the 38 kV aluminum structure, and the 15 kV switchgear; the grid design shall be coordinated with LUMA requirements

REQUIRED: The substation ground grid design shall be submitted for Owner/Engineer review at Design Development phase. Ground grid resistance shall be measured at completion and submitted with the field test report.

3.03 FIELD ACCEPTANCE TESTING

A. All field acceptance tests shall be performed in accordance with PREPA Letter dated May 28, 2003, which establishes the required testing protocol for transformer installations on the Puerto Rico electric system. A copy of the PREPA Letter shall be included in the project closeout documentation.

B. Before energizing, conduct the following acceptance tests in the presence of the Owner's Representative and submit a certified test report:

C. Visual and Mechanical Inspection:

1. Verify nameplate data against specification and approved shop drawings
2. Inspect tank, bushings, accessories, and connections for shipping damage
3. Verify all accessories installed and functional: gauges readable, PRV operable, fans rotate freely, auxiliary contacts wired and operable
4. Verify tap changer position per voltage study recommendations; document position on test report
5. Verify insulating liquid level at correct mark
6. Verify anchor bolts torqued per specification
7. Verify spill containment basin and oil/water separator are functional
8. Verify all safety signs, labels, and hazard markings installed

D. Insulating Liquid Testing:

1. Sample and test insulating liquid per IEEE C57.106 (mineral oil) or appropriate ASTM standard for less-flammable liquid: dielectric breakdown voltage (minimum 30 kV per ASTM D877 or manufacturer's minimum), moisture content (PPM), acidity - confirm liquid is suitable for energization
2. Liquid test report to be submitted before energization authorization is granted

E. Insulation Resistance (IR) Testing:

1. Measure winding-to-winding and winding-to-ground insulation resistance using a 5,000 V DC megohmmeter
2. Measure polarization index (PI) - ratio of 10-minute to 1-minute IR reading; minimum PI of 2.0 for new transformers
3. Record ambient temperature and correct readings to 20°C

F. Turns Ratio Testing:

1. Verify voltage ratio at each tap position using an automated transformer turns ratio (TTR) tester
2. Acceptable deviation: ±0.5% of nameplate ratio at the selected tap position

G. Auxiliary Contact and Alarm Verification: Verify continuity and correct operation of all auxiliary contacts (Items H, I, J) and the rapid pressure rise relay (Item F) by simulation/injection at the alarm panel; confirm annunciation at local alarm panel.

H. Cooling Fan Test: Energize cooling fans from control power panelboard; verify all fans start and run correctly; verify automatic control scheme activates and deactivates fans per control logic.

I. Substation Ground Grid Test: Perform a substation ground grid resistance test per IEEE 80 and LUMA requirements prior to energization.

3.04 TRAINING

A. Provide a minimum of four (4) hours of on-site operations and maintenance training for Owner's facility engineering staff following transformer commissioning. Training shall include:

1. Normal operating parameters and what constitutes an alarm condition
2. How to safely check liquid level, temperature, and pressure gauges
3. What to do if an alarm activates (rapid pressure rise relay, PRV operation, low liquid level)
4. Tap changer operation procedure (de-energize, lock out, change tap, re-energize)
5. Routine maintenance schedule and liquid sampling procedure
6. When to call for manufacturer service

3.05 CLOSEOUT SUBMITTALS

A. Submit the following prior to Substantial Completion:

1. Certified field acceptance test report (all tests in Article 3.3, signed by qualified testing engineer)
2. As-built drawings reflecting final installed configuration, final tap position, and any field changes
3. O&M manuals (see Article 1.3.C)
4. Training completion record with attendees and topics covered
5. Insulating liquid test reports (factory and field samples)
6. Anchor bolt torque records

END OF SECTION 16550

SECTION 16600 DOUBLE-ENDED SUBSTATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: This Section specifies the design, manufacture, factory testing, delivery, installation, field testing, and commissioning of the newly manufactured Double-Ended Substation (indoor, secondary unit substation type) for the Puerto Rico Trauma Hospital, Basement Main Electrical Room, comprising: two (2) 13.2 kV duplex load-break switch and fuse assemblies; two (2) indoor dry-type substation transformers; and the seven-section 480Y/277 V double-ended secondary switchgear lineup consisting of two (2) electrically-operated main circuit breakers, one (1) electrically-operated tie breaker, and four (4) distribution breaker sections, complete with the automatic/manual tie breaker transfer scheme, protective relaying, metering, instrumentation, and control wiring described herein. The Switchgear Manufacturer shall furnish all equipment with a practical layout consistent with good engineering practice and with provision for future expansion, and shall be responsible for factory testing and comprehensive system start-up and site testing.

B. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16112 - Raceways and Conduits (13.2 kV feeder duct banks and manholes between the outdoor yard substation and this Section's duplex switches)
3. Section 16120 - Wire and Cable (13.2 kV feeder cable terminating at the duplex load-break switches)
4. Section 16550 - 38 kV Power Transformers (upstream outdoor yard-type substation and 15 kV primary switchgear feeding this Section's duplex primary switches via the two independent 13.2 kV feeders of Bridging Document Section 4.3)
5. Section 16700 - Automatic Transfer Switches (downstream of this Section's four distribution breaker sections; each of the four building load categories - Life Safety, Critical, Equipment System, and Optional Standby - is fed from its dedicated distribution breaker section)
6. Section 16800 - Paralleling Switchgear (separate but interconnected emergency generator paralleling assembly; coordinate SCADA/PLC data exchange and normal/emergency source sequencing with the Automatic Transfer Switches of Section 16700)

1.02 APPLICABLE CODES AND STANDARDS - MEDIUM VOLTAGE SECTIONS

A. The design, equipment, installation, and testing of the medium-voltage (13.2 kV) sections of this Double-Ended Substation shall be in strict accordance with the applicable requirements of ANSI, UL, IEEE, and NEMA, latest editions adopted in Puerto Rico, except where a specific edition or standard number is cited below, in which case the cited standard number governs.

B. Due to the critical nature of this facility and to provide maximum reliability and single-point responsibility, the entire Double-Ended Substation system, including all controls, breakers, bus work, and components, shall be completely manufactured and assembled by a single manufacturer. The switchgear and controls shall be UL listed and labeled under the manufacturer's name at the time of bid opening.

C. All equipment and material supplied shall comply with the latest edition and amendments of the following standards, codes, and regulations:

1. ANSI/IEEE C12 - Code for Electric Metering
2. ANSI C37.04 - Standard Rating Structure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis
3. ANSI C37.06 - Preferred Ratings and Related Required Capabilities for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis
4. ANSI C37.11 - Requirements for Electrical Control for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis or a Total Current Basis
5. ANSI C37.12 - Guide to Specifications for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis or a Total Current Basis
6. ANSI C37.20 - Standard for Switchgear Assemblies Including Metal-Enclosed Bus
7. ANSI/IEEE C39.1 - Requirements for Electrical Analog Indicating Instruments
8. ANSI C57.13 - Requirements for Instrument Transformers
9. ANSI Z55.1 - Gray Finishes for Industrial Apparatus and Equipment
10. ANSI/IEEE 48 - Test Procedures and Requirements for High-Voltage AC Cable Terminations
11. NFPA 70 - National Electrical Code (NEC), latest edition adopted in Puerto Rico
12. NFPA 110 - Emergency and Standby Power Systems, latest edition adopted in Puerto Rico
13. Underwriters Laboratories, Inc. (UL)
14. National Electrical Manufacturers Association (NEMA)
15. Federal, Commonwealth of Puerto Rico, and local codes

1.03 APPLICABLE CODES AND STANDARDS - LOW VOLTAGE SECTIONS

A. The design, equipment, installation, and testing of the low-voltage (480 V) secondary switchgear sections of this Double-Ended Substation shall likewise be in strict accordance with the applicable requirements of ANSI, UL, IEEE, and NEMA.

B. The low-voltage switchgear construction, including all internal components mounted therein, shall be listed and labeled under UL Standard 1558 with a bus withstand rating of 100,000 amperes symmetrical for four (4) cycles minimum, at the time of bid opening. Manufacturers submitting air power breaker cubicles without UL 1558 listing and labeling with this withstand rating prior to bid opening shall not be accepted.

C. Due to the critical nature of this facility and to provide maximum reliability and single-point responsibility, the entire low-voltage switchgear system, including all controls, breakers, bus work, and components, shall be completely manufactured and assembled by a single manufacturer and shall be UL listed and labeled under the manufacturer's name at the time of bid opening. Manufacturers not listed and labeled by UL under "Circuit Breakers and Metal-Enclosed Switchgear under 600 Volts" at the time of bid opening shall not be acceptable.

D. All equipment and material supplied shall comply with the latest edition and amendments of the following standards, codes, and regulations:

1. ANSI/IEEE C12 - Code for Electric Metering
2. ANSI C37.20.1 - Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
3. ANSI/IEEE C39.1 - Requirements for Electrical Analog Indicating Instruments
4. ANSI C57.13 - Requirements for Instrument Transformers
5. Federal Specification W-C-375 - Circuit Breakers, Molded Case, Branch Circuit and Service
6. Federal Specification W-F-370 - Fuseholders (For Plug and Enclosed Cartridge Fuses)
7. NEMA AB 1 - Molded Case Circuit Breakers
8. NEMA KS 1 - Enclosed Switches
9. NEMA ICS 1 - General Standards for Industrial Control and Systems
10. NEMA PB 2.1 - Instructions for Safe Handling, Installation, Operation, and Maintenance of Dead-Front Distribution Switchboards Rated 600 Volts or Less
11. NFPA 70 - National Electrical Code (NEC), latest edition adopted in Puerto Rico, including Article 230 (Services), Article 240 (Overcurrent Protection), Article 450 (Transformers), and Article 517 (Health Care Facilities)
12. NFPA 110 - Emergency and Standby Power Systems, latest edition adopted in Puerto Rico

13. Underwriters Laboratories, Inc. (UL 1558, UL 1561)
14. Federal, Commonwealth of Puerto Rico, and local codes

1.04 SWITCHGEAR MANUFACTURER QUALIFICATIONS

A. It is the intent of the Owner to receive bids only from manufacturers adequately qualified to provide a highly reliable, fully integrated, state-of-the-art Double-Ended Substation switchgear system that can be successfully supported by the manufacturer over the lifetime of the system. Qualified bidders shall meet the following requirements and provide the necessary supporting documentation; failure to provide this documentation shall be considered a non-responsive bid and shall result in bid disqualification.

B. The manufacturer shall be a well-established company regularly engaged in the application, engineering, manufacturing, integration, and testing of critical electrical power control switchgear systems, and shall have a minimum of ten (10) years of experience in the design and manufacture of power control switchgear systems, automatic transfer switches, and related tie breaker/bus transfer schemes.

C. The manufacturer shall have adequate factory-employed field service personnel on staff for installation support, start-up, and life-of-system field support. Factory field service shall be available twenty-four (24) hours a day, 365 days a year; the manufacturer may not subcontract field service personnel. A 24-hour, toll-free hotline with a guaranteed call-back response within one (1) hour from a qualified factory technician shall be in place at the time of bid offering, with a proven history of response. Any manufacturer wishing to limit itself to a maximum number and type of field service visits for equipment start-up shall state so in its bid, together with published field service rates (including overtime and holiday rates) for additional visits.

D. The approved manufacturer is Russelectric or other Owner-approved equal.

1.05 SUBMITTALS

A. The Switchgear Manufacturer shall furnish a submittal with information adequate to fully define the system offered, including at minimum:

1. A single-line diagram clearly indicating the functional relationship between all equipment, from the 13.2 kV duplex switches through the transformers to the double-ended secondary switchgear and the Automatic Transfer Switches of Section 16700
2. Outline drawings showing plan and elevation views of each piece of equipment, including size, weight, dimensions and weight of shipping splits, and typical conduit entry areas
3. Detailed cubicle front-view drawings and equipment door-detail drawings showing all meter, annunciator, and control device locations, with nameplate legends and all required nameplate information

4. Base plans showing equipment floor channels, anchor bolt locations, and conduit entrance spaces
5. Catalog data sheets for all circuit breakers, load-break switches, fuses, and protective devices
6. Short-circuit rating of all bus, and interrupting and withstand ratings of all breakers and switches
7. Detailed bill of material identifying long-lead items for early release
8. System delivery schedule
9. Proposed sequence of operation for the entire system, including the automatic/manual tie breaker transfer logic
10. A statement listing all deviations and/or exceptions to this Specification

B. Two copies of the reviewed submittal, approved and stamped by the consulting engineer, will be returned to the Switchgear Manufacturer for production release.

1.06 OPERATING AND MAINTENANCE MANUALS

A. The Switchgear Manufacturer shall submit a complete hard copy and two electronic copies of the O&M manuals within two weeks after conclusion of equipment start-up and final acceptance. These manuals shall include, but not be limited to:

1. Detailed operating and maintenance instructions
2. All approved "As-Built" shop drawing information updated to "As-Installed," including all field modifications
3. Assembly splice-plate details for interconnection of shipping sections
4. Wiring diagrams for each breaker, switch, and other device, with all terminal markings and connections to other circuits
5. Internal connection diagrams of relays, instruments, and control switches
6. A complete parts list with all principal parts identified by manufacturer, type, and model number
7. A recommended spare parts list, with pricing, for one year of operation
8. A hard copy of the equipment PLC/control program, bound separately
9. Complete system interconnect diagrams

C. The manufacturer shall provide an optional, comprehensive preventive maintenance program.

D. A complete set of O&M manuals shall be delivered to the Owner prior to training of Owner personnel.

E. O&M manuals shall contain 100% accurate As-Installed drawings, interconnect diagrams, schematic diagrams, wiring diagrams, individual subsystem component manuals, operating procedures, a system description with theory of operation, maintenance schedules and procedures, original programmed settings and parameters (including all breaker trip unit and ABT/tie breaker settings), and all other information necessary for the Owner to maintain, operate, test, and troubleshoot the system.

F. O&M manuals shall not rely solely on sub-component manuals; a thorough consolidation of operation and maintenance information shall be provided in a system overview guide covering all major components - breakers, tie breaker controls, PLC/OIP interface, protective relays, meters, and the Master Control/annunciator cubicle.

1.07 WARRANTY

A. The Manufacturer shall provide a complete minimum two (2) year warranty from the date of shipment. Any failure to comply with the Contract Documents, or any defect appearing within the warranty period, shall be corrected at no cost to the Owner.

1.08 QUALITY ASSURANCE

A. Single Source Responsibility: All components of the Double-Ended Substation - the 13.2 kV duplex load-break switch and fuse assemblies, the indoor dry-type transformers, and the 480 V double-ended secondary switchgear (main breakers, tie breaker, and distribution breaker sections) - shall be supplied by a single manufacturer to ensure full system compatibility, coordinated ratings, and unified warranty responsibility, per Section 1.2.B and Section 1.3.C above.

B. Protective Device Coordination: The D&B Contractor's licensed Electrical Engineer shall prepare and submit the full protective device coordination study, arc flash hazard analysis, and fault current study at the 13.2 kV building substation primary and at the 480 V switchgear bus (with both transformers contributing) at the Design Development (DD) phase, per Bridging Document Section 4.3. All breaker trip unit settings shall be programmed, verified, and documented before energization.

C. NEC 517.17 Compliance (Two-Level Ground Fault Protection): The ground fault protection (GFP) scheme provided on each main circuit breaker (Section 2.4) and on each feeder breaker serving patient care areas in the distribution breaker sections (Section 2.7) shall be fully selective and time-coordinated as required by NEC 230.95 and NEC 517.17, and shall be verified by the protective device coordination study. Main breaker and tie breaker trip units shall include Zone Selective Interlocking (ZSI) capability to achieve high-speed selective coordination with the downstream feeder breakers without sacrificing clearing time.

D. Factory Testing: All major equipment shall undergo the routine and production factory testing specified in Part 3, Section 3.2 of this Section, with test reports

submitted to the Owner's Engineer before delivery acceptance. Field energization shall not proceed without written Engineer approval.

E. Spare Capacity: The minimum 10% spare capacity required by Section 16100, Section 1.4.A shall be maintained in the secondary switchgear bus ratings and in the future breaker spaces provisioned in the distribution breaker sections.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with the requirements specified herein, the approved manufacturer for the complete, single-source Double-Ended Substation system (duplex switches, transformers, and secondary switchgear) is Russelectric or other Owner-approved equal.

2.02 SYSTEM OVERVIEW

A. Furnish the Double-Ended Substation (DES) as shown on the Drawings, with automatic or manual tie breaker operation at the discretion of operating personnel. The incoming 13.2 kV section shall be three-phase, three-wire, and the 480 V distribution section shall be three-phase, four-wire. Individual cubicles of the Double-Ended Substation switchgear shall be UL listed and labeled as applicable under UL 1561 (transformer cubicles) and UL 1558 (low-voltage switchgear cubicles). Manufacturers not listed and labeled by UL at the time of bid opening shall not be acceptable.

B. The switchgear shall be arranged for fully automatic or manual operation at the discretion of the operator. In the automatic mode, the tie breaker transfer function shall be supervised by the facility's programmable logic controller (PLC) and operator interface panel (OIP) system described in Section 2.7 below, coordinated with the generator paralleling switchgear of Section 16800. The system shall also be designed to provide safe manual operation completely independent of the automatic PLC/OIP system, using hard-wired interlocks, instruments, and control switches as specified herein. Each switchgear section shall be complete with the necessary AC instrumentation, relaying, pilot lights, selector switches, and accessories specified in this Section.

C. Control power for the PLC, relaying, and control circuitry described in this Section shall be derived from a reliable, code-compliant DC control power source (station battery/charger system) coordinated with the facility's emergency power control systems; AC control power shall be derived from the potential transformers and control power transformers specified herein.

D. All system operation and control functions shall be coordinated and integrated such that during automatic and/or manual operation, no unsafe condition and no

malfunction of intended operation shall occur, and the highest possible reliability of operation shall be maintained.

E. Coordinate and integrate the functions and circuitry of all selector switches to ensure that the available settings do not cause a malfunction of the intended system operation.

2.03 SEQUENCE OF OPERATION - DOUBLE-ENDED SUBSTATION

A. The switchgear shall operate as directed by a two-position Auto-Manual Tie Breaker Selector Switch, located in the Tie Breaker Cubicle, to select Automatic or Manual tie breaker operation.

B. The normal positions of the switchgear breakers shall be:

1. Main Breaker 1 (MB-1, fed from Transformer 1 / 13.2 kV Duplex Switch 1) - Normally Closed
2. Main Breaker 2 (MB-2, fed from Transformer 2 / 13.2 kV Duplex Switch 2) - Normally Closed
3. Tie Breaker (TB) - Normally Open

C. Automatic Mode: When the Auto-Manual Tie Breaker Selector Switch is in the AUTO position and a power failure occurs on one of the two incoming sources (loss of the associated transformer or main breaker) while the second source remains available, the switchgear shall wait through an adjustable 0-300 second time delay for restoration of the failed source, with voltage supervision on both bus sections to confirm a genuine dead-bus condition before any transfer. If, at expiration of the time delay, the failed source has not been restored, the associated main breaker shall open and the tie breaker shall close (within 4 cycles / 67 milliseconds of the transfer command being issued) to feed both bus sections from the surviving main breaker/transformer. When the failed source returns, after an adjustable time delay, the switchgear shall open the tie breaker and close the main breaker that was open, retransferring the loads in an open-transition sequence so that each main breaker again feeds its own bus section. The open-transition retransfer time shall be adjustable from the OIP. An anti-paralleling interlock shall prohibit the tie breaker from closing while both main breakers are simultaneously closed.

D. If both incoming sources fail simultaneously while in AUTO mode, all switchgear breakers shall remain in their existing position.

E. Manual Mode: When the Auto-Manual Selector Switch is in the MANUAL position, the switchgear can be operated only manually, and all manual operations shall be of the open-transition type. The switchgear shall be designed with the following interlocks to prevent operator error:

1. A main breaker shall not be able to close if the tie breaker and the other main breaker are both closed; either the tie breaker or the opposite main breaker must first be opened before the main breaker is allowed to close

2. The tie breaker shall not be able to close unless one of the two main breakers is open; if both main breakers are closed, one must be opened before the tie breaker is allowed to close

F. The switchgear shall transmit breaker status, power monitoring data, alarms, events, and a one-line diagram display to the SCADA/BMS system; control and settings shall be accessible from the SCADA desktop and the Paralleling Switchgear OIP.

2.04 CIRCUIT BREAKERS - MAIN AND TIE CIRCUIT BREAKERS

A. General: All breakers of the switchgear (MB-1, MB-2, and the Tie Breaker) shall be three-pole, draw-out type, provided with self-aligning line-side and load-side disconnecting devices. The main and tie circuit breakers shall be electrically operated, interchangeable with each other, minimum 5,000 A frame, 100% continuous-duty rated, and equipped with stored-energy operating mechanisms.

B. Rating: Breakers shall be rated nominal 480 VAC, three-phase, 60 Hz, with a minimum interrupting rating of 100 kAIC (preliminary; subject to confirmation by the final fault current study). Continuous current rating shall be as indicated on the Contract Drawings, and in no case less than the 5,000 A minimum bus continuous rating specified in Section 2.8 below; breaker trip rating shall be sized to match the transformer full-load current at 480 V (3,750 kVA at 480 V equals approximately 4,510 A full load), confirmed by the D&B Contractor's load calculation. Rated dielectric strength shall be per ANSI C37.04 and C37.06 for this nominal voltage class.

C. Trip Unit: Each breaker's trip unit shall be fully electronic, microprocessor-based, with independently adjustable Long-Time (LT), Short-Time (ST), Instantaneous (INST), and Ground Fault (GF) overcurrent protection, individual dials and adjustable rating plugs for trip settings, and internal sensors to power the trip unit. Ground fault protection shall be provided per NEC 230.95 and NEC 517.17 on each main breaker, and the trip unit shall include Zone Selective Interlocking (ZSI) capability so that the main breaker and tie breaker GFP and short-time functions are time-coordinated with the downstream distribution feeder breakers (Section 2.7) for fully selective, two-level ground fault protection as required by NEC 517.17 in this health care facility, minimizing nuisance tripping of the entire bus on a downstream fault.

D. Metering: Each breaker trip unit shall be supplied with 1.5% accuracy digital ammeter (power) metering with LCD display and a Modbus communication module to transmit current/power information to remote systems, including the operator interface panel (OIP) of the Paralleling Switchgear; an operator shall be able to view metered information at the OIP by selecting the breaker on the single-line screen.

E. Standards: Voltages, currents, interrupting ratings, operating times, and duty cycle shall be in accordance with ANSI C37.04 and C37.06.

F. Operating Mechanism: Stored-energy type, maximum closing time 5 cycles; control voltage 24 VDC trip, 120 VAC close and charge.

G. Auxiliary Contacts: Provide auxiliary contacts, interlocks, and relays as required for control, alarm, and interlocking functions, plus a minimum of four (4) spare auxiliary contacts (two "a" and two "b") on each breaker.

H. Interchangeability: Per ANSI C37.20.

I. Operation: Breaker controls shall function in both the OPERATE and TEST positions of the breaker.

J. Control Wiring: Breaker control wiring shall be per ANSI C37.11, with separate fusing of close and trip circuits.

K. Manual Operation: Provide means for integral manual tripping and closing of each breaker.

L. Interlocks: Provide a mechanical interlock preventing removal or insertion of a breaker while in the closed position, and an interlock that automatically discharges the closing springs upon removal from, or insertion into, the compartment. In addition to these individual-breaker interlocks, provide the mechanical and electrical key interlocking described in Section 2.3 above between MB-1, MB-2, and the Tie Breaker to enforce the double-ended closed-bus/open-tie operating modes.

2.05 INCOMING 13.2 KV DUPLEX LOAD-BREAK SWITCHES

A. Provide two (2) UL-listed 13.2 kV, 600 A duplex-configuration load-break switches, one per transformer. Each duplex switch shall provide two (2) incoming positions, each connected to one of the two separate, independent 13.2 kV feeders, with a common load-side bus feeding the associated transformer through a set of fuses. This duplex arrangement allows either of the two incoming 13.2 kV feeders to be manually selected to serve either transformer, providing full two-source feeder redundancy at the 13.2 kV level - loss of one 13.2 kV feeder does not interrupt service to either transformer, because each duplex switch can be manually switched to the surviving feeder.

B. Provide key interlocks on each duplex assembly to permit only one of the two incoming switch positions to be closed at any one time.

NOTE: The duplex switch arrangement is a two-source, manual-transfer medium-voltage switching scheme; it does not provide automatic feeder transfer at 13.2 kV. Any feeder switching at 13.2 kV requires de-energizing the affected position and complying with NFPA 70E electrical safe work practices for medium-voltage equipment.

2.06 TRANSFORMERS

A. Provide two (2) indoor, dry-type substation transformers, each rated 3,750 kVA. Primary: 13.2 kV delta, three-phase, three-wire; Secondary: 480Y/277 V wye, three-phase, four-wire, 60 Hz, with two 2-1/2% full-capacity taps above normal and two 2-1/2% full-capacity taps below normal on the primary winding. All transformers shall

have an average winding temperature rise of 80 degrees C above a 40 degree C maximum, 30 degree C average ambient.

B. Impedance: The transformer impedance shall not be lower than 6.00% at rated kVA and frequency, and shall be increased above this standard minimum value, as necessary and confirmed with the manufacturer, to limit the available fault current at the 480 V switchgear bus due to the proximity of downstream distribution equipment and the resulting high available short-circuit currents at this bus, per Bridging Document Section 4.3.

C. DOE Compliance: The transformers shall comply with 10 CFR Part 431 as registered on the U.S. Department of Energy's Compliance Certification Database per 10 CFR Part 429.

D. Cooling: Fan cooling equipment shall include a three-phase electronic winding temperature monitor, controlled automatically by Type K thermocouples placed in the low-voltage air duct. The temperature monitor shall contain yellow and red indicating lights - yellow indicating fan power, red signaling that alarm and trip contacts have been activated - and shall provide an adjustable analog milliampere output for remote indication. Alarm contacts shall be provided for fan status, high-temperature alarm, and trip functions, and an audible alarm shall sound when the highest phase temperature exceeds a preset point. Fans shall be capable of manual or automatic operation; a minimum of six (6) fans shall be provided. The forced-air cooling system shall include fans, control wiring, a controller with test switch, current-limiting fusing in the controller's power supply, indicating lights, an alarm-silencing relay, an auto/manual switch, and all necessary accessories.

E. BIL: The basic impulse level (BIL) shall be a minimum of 95 kV.

F. Windings: Coils shall be wound with copper conductors (both primary and secondary).

G. Insulation System: All insulating materials shall be in accordance with IEEE C57.12.01, 220 degree C UL insulation system (Class H).

H. Core: Cores shall be constructed of high-grade, grain-oriented, non-aging silicon steel with high magnetic permeability and low hysteresis and eddy current losses; magnetic flux densities shall be kept well below saturation. Core laminations shall be step-lap, miter-cut at the corners to reduce hot spots, core loss, excitation current, and sound level. The core shall be visibly grounded to the ground bus or ground pad by a flexible grounding conductor.

I. VPI/VPE Process: The coils and clamping structure shall be assembled on the core and dried at atmospheric pressure in a hot-air circulating oven. The totally assembled core-and-coil assembly shall be vacuum-pressure impregnated (VPI) in polyester varnish, applying a one-cycle polyester protective shield of varnish, cured on an established temperature-versus-time baking cycle, effectively impregnating the entire assembly to render it virtually impermeable to moisture, dust, salt air, and

other industrial contaminants. In addition, the vacuum-pressure-encapsulated (VPE) process shall apply multiple coats of silicone varnish to provide a still higher degree of protection from moisture, consistent with the coastal/tropical service environment of this project.

J. Enclosure: Transformer enclosures shall be fabricated of heavy-gauge sheet steel, ventilated, indoor type as required by the Drawings, with lifting provisions on the base structure and jacking pads flush with the enclosure. The base shall be constructed of steel members permitting skidding or rolling in any direction. Rubber vibration-isolation pads shall be installed by the manufacturer between the core-and-coil assembly and the enclosure.

K. Sound Level: Transformer sound levels shall be warranted by the manufacturer not to exceed the values specified in IEEE C57.12.01.

2.07 CONTROL AND SAFETY DEVICES

A. Annunciator Panel: A back-lit LED annunciation panel shall be provided with individual 1.575 in. x 1.575 in. square translucent windows and black-engraved 3/8 in. lettering indicating the nature of each alarm, failure, or status condition. LED indicators shall be plug-in type with a dual-circuit design incorporating four redundant strings of LEDs, such that a failed LED string does not render the lamp inoperative. A push-to-test button shall be furnished on each annunciated section.

B. Current Transformers: 0-5 ampere output, wound type, molded construction, single secondary winding, primary/secondary ratio as required, burden and accuracy consistent with the connected metering and relay devices; rated 50-400 Hz, 600 V at 10 kV BIL full wave; built to ANSI/IEEE C57.13 and UL in accordance with IEC 44-1.

C. Manual-Auto Control Switch: A two-position selector switch labeled "Manual-Auto" shall be provided on the Tie Breaker Cubicle door, per Section 2.3.A above. Whenever this switch is placed in the MANUAL position, the system shall annunciate this condition.

D. Meters: Multi-function power meters capable of reading all electrical power measurements, with digital communications capability, shall be provided at each main breaker, tie breaker, and distribution feeder cubicle.

E. Potential Transformers: Rollout potential transformers, open-delta primary to open-delta secondary, 120 V single secondary, primary fusing and secondary circuit breaker protection, primary/secondary ratio as required, burden and accuracy consistent with the connected metering and relay devices, 60 Hz.

F. Protective Relaying: All protective relaying shall be separate from, and independent of, the PLC control system.

G. Programmable Controllers: The automatic tie breaker transfer function shall be controlled by two redundant, hot-standby programmable automation controllers (PLCs), located in the Paralleling Switchgear of Section 16800, with dual redundant

reflective memory modules in each to provide high-speed, redundant fiber communications synchronizing the scans between the two PLCs. Each PLC shall have a separate power supply and chassis with distributed input/output cards on a ring communications topology, backed up by non-volatile flash memory. If both PLCs become inoperable, the switchgear system shall default to full manual control with all required hard-wired interlocks in place, and shall provide audible and visual alarms to alert personnel so corrective action can be taken.

H. Over/Under Voltage and Frequency Relay: An overvoltage (100-125%), undervoltage (75-100%), overfrequency, and underfrequency relay shall be supplied to monitor the incoming voltage on each bus section and provide alarms and initiate automatic transfer sequences as required for abnormal conditions; each setpoint shall have an independent, adjustable time delay (1 to 30 seconds).

I. Automatic Tie Breaker Control: The automatic tie breaker function shall be controlled by the hot-standby, dual-redundant PLC system described above, utilizing distributed I/O residing in the Tie Breaker Cubicle with its own power supply, chassis, and input/output cards. In the event of a failure of both PLCs or an I/O module, the system shall be arranged so that an operator can manually operate the switchgear. A fail-to-close or fail-to-open time-delayed alarm function shall sound a warning horn in the event the Tie Breaker or either Main Breaker fails to operate as commanded; after such a failure to operate automatically, the operator may, at his discretion, operate the system manually by turning the Tie Breaker Auto-Manual Switch to the MANUAL position.

2.08 MAIN BUS SECTIONS - RATINGS AND INSTRUMENT/CONTROL WIRING

A. Bus Ratings: Copper bus bars, silver-plated at all joints and connections; minimum 5,000 A continuous rating per bus section (Bus 1 and Bus 2), confirmed by the D&B Contractor's load calculation; bus rated for 100% continuous duty and fully braced for the available fault current at the 480 V bus with both transformers contributing, per the fault current study of Section 1.5.A.11 above.

B. Instrument and Control Wiring: Instrument and control wiring within the switchgear sections shall be flame-retardant, type SIS, extra-flexible, tinned copper, rated 600 V and approved for switchgear use.

C. Control wiring shall be protected by individual circuit breakers with trip indication, monitored by the system PLC and alarmed on the OIP.

D. All wire terminations at meters, relays, and similar devices shall use ring-tongue or locking-spade crimp lugs, or as required by the device termination point.

E. All terminations shall be clearly identified by heat-embossed vinyl sleeve markers at each end; labeling tape or paper wire markers are not acceptable. Wire numbers shall match the manufacturer's interconnection, schematic, and wiring drawings.

F. Terminal blocks shall utilize cage-clamp technology, supplied and clearly marked for wiring to be installed or reconnected by the Contractor. All connections between

shipping sections shall utilize plug connections to reduce installation time; cage-clamp terminal blocks providing high clamping force, maintenance-free terminations shall be provided for all secondary wire terminations.

G. All current transformers shall be connected to shorting-type mechanical lever-arm switches with test points; current transformer secondary wiring shall be #12 AWG.

H. Control wiring shall be labeled at each terminal point with designations keyed to the wiring diagrams.

2.09 SWITCHGEAR CONSTRUCTION

A. Framework:

1. Freestanding, floor-mounted, indoor type, NEMA 1
2. Dead front, dead rear
3. Fabricated on a die-formed steel base or base assembly, welded or bolted together to rigidly support the entire shipping unit for moving on rollers and floor mounting
4. Die-pierced holes for connecting adjacent sections to assure alignment and facilitate future additions
5. Bolts, nuts, and Belleville spring washers shall be zinc-plated
6. Designed to withstand the mechanical stresses of rough handling during shipment, in addition to the electrical and mechanical stresses occurring during operation
7. Framework formed of code-gauge steel (12 gauge minimum), suitable for anchorage to the floor
8. Rugged steel assemblies with bracing, reinforcing gussets, and jig-welding to assure rectangular rigidity; sections shall be completely metal-enclosed
9. Each section shall have an open bottom as required for ready installation and termination of conduits; top and bottom conduit/bus duct areas shall be clearly shown and dimensioned on the shop drawings
10. All side, top, front, and back panels shall be removable, bolt-attached, and sized for easy handling by one person
11. Front and rear doors, hinge-mounted with lock-type operating handles, on all cubicles for easy access
12. Individual front doors shall be supplied for each power circuit breaker compartment; layout to be reviewed with the shop drawing submittal
13. Suitable provisions near the top and bottom of the switchboard to ensure adequate ventilation for all equipment within the assembly

B. Dimensions:

1. Conform to the arrangements and details shown on the Drawings and to the space designated for installation
2. Constructed so the highest operating handle does not exceed 6 ft-6 in. above the switchgear sill
3. Adequate gutter space on all sides of the switchboard sections; clearance to permit good accessibility of feeder conductors and bus ducts

C. Painting: All steel parts shall be prepared for painting by a five-step cleaning, phosphatizing, and sealing process, then painted ANSI 61 gray using electrostatically applied polyester powder coating cured in a baking oven, suitable for outdoor as well as indoor applications, with corrosion resistance per ASTM B117 for 1,000 hours minimum.

D. Bus Bars and Interconnections:

1. All buses and stub connections shall be silver-plated copper, plated after bending and machining; 480 V, three-phase, four-wire, 60 Hz unless otherwise specified. Bus size shall limit current density to not more than the current-carrying capacity of the rectangular copper bars, per UL and NEMA standards; heat-rise tests per UL 1558
2. Buses and stub connections shall limit temperature rise to 30 degrees C at load current capacity, 40 degrees C ambient
3. Bus bar and interconnection joints shall be silver-plated, constant-high-pressure type, with Grade 5 steel, zinc-plated bolts, nuts, and Belleville spring washers
4. Bus bracing capacity shall be equal to or greater than the frame rating of the main breakers served
5. A ground bus with not less than 25% of the current-carrying capacity of the switchgear main bus shall extend the entire width of the switchboard assembly
6. Bus phase designations front to back, top to bottom, left to right shall be A, B, C respectively, viewed from the front
7. Main horizontal bus bars between sections shall be located to permit maximum conduit and wiring area
8. The continuous ampere rating of the main power bus shall be as shown on the Contract Drawings and not less than the 5,000 A minimum of Section 2.8.A above; bus connections to the power circuit breakers shall match the breaker frame size to which they are connected

E. The switchgear shall consist of metal-enclosed cubicles and auxiliary compartments, characterized by the following:

1. Power circuit breakers installed in individual front compartments with separate doors

2. Buses installed in rear compartments, with inter-cubicle and/or rear cable compartment isolation barriers
3. All compartments completely enclosed within grounded metal barriers, isolating secondary control devices and their wiring from all 480 V primary devices
4. Interlocks provided for proper sequencing and safe operation
5. Where a rear compartment houses any control components, grounded metal personnel-protection barriers shall isolate the bus compartments
6. The medium-voltage (13.2 kV duplex switch) sections of the switchgear shall conform to Section 2.5 above

F. Nameplates: Externally visible, permanent nameplates shall identify each instrument, instrument switch, meter, protective relay, control switch, indicating light, and circuit breaker compartment, with relays designated as to use and connected phase; nameplates shall be laminated plastic, bolt-attached, white-engraved characters on a black background. Equipment (relays, timers, PLC equipment, etc.) and terminal blocks within compartments shall be identified by thermally embossed labeling tape.

G. Miscellaneous: System controls shall utilize heavy-duty, industrial-grade controls and relays; all synchronizing and failure-circuit relays shall embody the fail-safe principle of dual contacts in parallel. The switchgear manufacturer shall be responsible for coordinating wiring diagrams showing the electrical connections between this Section's equipment and related systems (Section 16700, Section 16800), for use by the Electrical Contractor during installation and checkout.

2.10 EQUIPMENT DESCRIPTION

The switchgear cubicles shall be UL 1558 listed and labeled. Manufacturers not listed and labeled by UL at the time of bid opening shall not be acceptable.

A. Switchgear Bus Arrangement - Seven-Section Lineup: The complete secondary switchgear lineup shall consist of seven (7) sections arranged left-to-right in the following order, per Bridging Document Section 5.1.1: Main Breaker Section 1 (MB-1) - Distribution Section 1 - Distribution Section 2 - Tie Breaker Section (TB) - Distribution Section 3 - Distribution Section 4 - Main Breaker Section 2 (MB-2). The four (4) Distribution Feeder Breaker Cubicles referenced in Item F below correspond to Distribution Sections 1 through 4 of this arrangement - two sections adjacent to, and served from, Bus 1/MB-1/Transformer 1, and two sections adjacent to, and served from, Bus 2/MB-2/Transformer 2 - and shall each feed one of the four building load categories (Life Safety, Critical, Equipment System, and Optional Standby) via its corresponding Automatic Transfer Switch specified in Section 16700.

B. Incoming Load Break Fused Disconnect Switch Cubicles: Furnish two (2) UL-listed metal-clad cubicles, each with a 15 kV-class incoming duplex load-break switch with one common load bus with fuses, per Section 2.5 above. Each cubicle shall have:

1. One 600 A, 15 kV, gang-operated load-break switch section
2. One 600 A, 15 kV, gang-operated load-break switch and a set of fuses in the common load bus section

C. Transformer Cubicles: Furnish two (2) transformer cubicles, UL listed and labeled substation type per UL 1561. Transformers shall comply with 10 CFR 431 as registered on the U.S. Department of Energy's Compliance Certification Database per 10 CFR 429, and with:

1. High-voltage terminations designed for close coupling to the load-break switch section, as shown on the Drawings; low-voltage terminations designed for close coupling to the Main Breaker cubicles, as shown on the Drawings
2. Transformer(s) rated and constructed as specified in Section 2.6 above
3. A set of three-phase, 5,000 A insulated copper bus and ground bus, as required for main bus and breaker connections
4. Control wiring, DC circuit breakers, fuses, fuse blocks, cage-clamp terminals, nameplates, etc., as required; all wiring labeled at both ends with tubular sleeve, permanent wire markers

D. Main Breaker Cubicles (MB-1, MB-2): The metal-clad Main Breaker cubicles, including all internal components, shall be listed and labeled under UL 1558 with a bus withstand rating of 100,000 amperes symmetrical for four (4) cycles minimum, and shall be furnished with:

1. One 5,000 A frame, electrically operated, draw-out power circuit breaker with adjustable overcurrent and short-circuit trips, rated 100 kAIC at 480 VAC, per Section 2.4 above
2. One circuit breaker control switch, with a separate back-lit LED annunciator for breaker status (open, closed, drawn out)
3. One multi-function power meter with digital communications
4. Lamp test switch
5. 125 VDC to 24 VDC converter
6. One multi-function utility/transformer-interconnection protection relay (ANSI device numbers 81 O/U, 50/51, 51G, 47, and 27/59)
7. One set of current transformers, ratio as required
8. One set of potential transformers, ratio as required
9. One set of three-phase, 5,000 A main bus, fully rated neutral bus, and separate ground bus, all silver-plated copper

10. A set of control wiring, DC circuit breakers, fuses, fuse blocks, terminals, and nameplates, all wiring labeled at both ends

E. Tie Breaker Cubicle: The metal-clad Tie Breaker cubicle, including all internal components, shall be listed and labeled under UL 1558 with a bus withstand rating of 100,000 amperes symmetrical for four (4) cycles minimum, and shall be furnished with:

1. One 5,000 A frame, electrically operated, draw-out power circuit breaker with adjustable overcurrent and short-circuit trips, rated 100 kAIC at 480 VAC, matching the main breakers per Section 2.4 above
2. One circuit breaker control switch, with a separate back-lit LED annunciator for breaker status (open, closed, drawn out)
3. One PLC distributed I/O module, complete with input/output modules, communication modules, and power supplies, for remote SCADA control and monitoring, per Section 2.7.I above
4. One multi-function power meter with digital communications
5. One two-position Tie Breaker Mode Selector Switch, with a "Tie Breaker Auto - Tie Breaker Manual" nameplate, operating as described in Section 2.3 above
6. A back-lit annunciation panel with the following indications:
    a. Tie Breaker in Auto Mode - Status - Green
    b. Tie Breaker in Manual Mode - Status - Amber (Flashing)
    c. Tie Breaker Failure to Close - Alarm - Red
    d. Tie Breaker Failure to Open - Alarm - Red
    e. Main Breaker 1 (MB-1) Failure to Close - Alarm - Red
    f. Main Breaker 1 (MB-1) Failure to Open - Alarm - Red
    g. Main Breaker 2 (MB-2) Failure to Close - Alarm - Red
    h. Main Breaker 2 (MB-2) Failure to Open - Alarm - Red
    i. Control Voltage Failure - Alarm - Red
    j. PLC I/O Drop Failure - Alarm - Red
7. Lamp test switch
8. 125 VDC to 24 VDC converter
9. One multi-function protection relay (ANSI device numbers 50/51, 51G)
10. One set of current transformers, ratio as required
11. One set of three-phase, 5,000 A main bus, fully rated neutral bus, and separate ground bus, all silver-plated copper
12. A set of control wiring, DC circuit breakers, fuses, fuse blocks, terminals, and nameplates, all wiring labeled at both ends

F. Distribution Feeder Breaker Cubicles: Furnish four (4) distribution feeder breaker cubicles (Distribution Sections 1 through 4 of Item A above), listed and labeled under UL 1558, one dedicated to each of the four building load categories (Life Safety, Critical, Equipment System, and Optional Standby), each feeding its corresponding Automatic Transfer Switch specified in Section 16700. Each cubicle shall have:

1. The quantity and frame/trip size of air power circuit breakers shown on the Drawings, draw-out type, manually operated, rated 100 kAIC at 480 VAC, with terminal lugs for each feeder as shown; ground fault protection per NEC 517.17 on all feeder breakers serving patient care areas, time-graded and selective with the main breaker GFP per Section 2.4.C above
2. One set of three-phase, 5,000 A main bus, fully rated neutral bus, and separate ground bus, all silver-plated copper
3. A set of control wiring, DC circuit breakers, fuses, fuse blocks, cage-clamp terminals, and nameplates, as required; all wiring labeled at both ends
4. Minimum one (1) future breaker space per distribution section, fully provisioned with bus stubs and draw-out rails, per Section 1.8.E above

G. Circuit Breaker Lifting Device: Provide an overhead circuit breaker hoist system to traverse the length of the power switchgear via a front-and-rear rail system. The overhead lift device shall be manually operated via hand crank, with a minimum rated capacity of 1,200 lbs.

PART 3 - EXECUTION

3.01 COORDINATION

A. The Switchgear Manufacturer shall be responsible for providing coordinating interconnect diagrams showing the electrical connections between all related equipment specified in this Section, for use by the Electrical Contractor and switchgear service personnel during installation and checkout.

B. The Switchgear Manufacturer shall verify completion of all start-up commissioning and site testing of the Double-Ended Substation switchgear system.

C. The Electrical Contractor shall be responsible for obtaining and providing the short-circuit, protective device coordination, and arc flash study specified in Section 1.5.A.11 above, and shall furnish a copy of the approved study to the Owner, the consulting engineer, and the switchgear manufacturer's start-up field engineer prior to commencement of switchgear start-up procedures.

3.02 FACTORY TESTING

A. At the factory, the Switchgear Manufacturer shall perform tests on the switchgear as required to verify proper operation of each component and demonstrate full compliance with this Specification. Factory test reports shall be available upon

request and, per Section 1.8.D above, shall be submitted to the Owner's Engineer before delivery is accepted.

B. The equipment shall be completely assembled, wired, adjusted, and tested at the factory. Rigid inspections before and after assembly shall assure correctness of design and workmanship. After assembly, each switchgear assembly shall be tested for operation under simulated conditions.

C. After a visual inspection, the following operational tests shall be performed:

1. Operate all circuit breakers in the connected and test positions; check the operation of all interlocks by attempting to close breakers into interlocked configurations
2. Check racking mechanisms by removing and reinstalling each circuit breaker
3. Check the stored-energy mechanism of each breaker by tripping, closing, and tripping the breaker after removal of control power
4. Perform dielectric (hi-pot) tests
5. Test all protective relay devices by simulation testing

3.03 PACKING AND SHIPPING

A. The Switchgear Manufacturer shall prepare all equipment covered by this Specification to protect it against damage in transit.

B. The Switchgear Manufacturer shall perform the following steps to prepare the equipment for shipping and final assembly at the site:

1. All equipment shall be adequately packed to prevent damage from handling, weather, shock, vibration, and corrosion during shipment by common carrier
2. All metering and equipment shall be protected to ensure cleanliness during shipment, storage, and erection
3. Each item of equipment shall be clearly marked; all boxes, crates, and shipments shall be numbered and identified with the following:
    a. Owner's purchase order number
    b. Owner's name and delivery location
    c. Manufacturer's name and address
    d. Contents
4. All equipment shall have provisions for lifting and skidding, with all lifting points clearly marked
5. Each shipping unit shall be braced adequately and rigidly, both internally and externally, to prevent damage during transit or erection
6. Assemblies requiring disassembly for installation, or shipped disassembled, shall have each affected piece uniquely identified as to its assembly position;

all loose peripheral equipment shall be boxed, crated, or otherwise completely enclosed and protected during storage, handling, and shipment

C. All equipment and material shall be shipped to the job site unless otherwise instructed.

D. All equipment shall be adequately protected, braced, and secured to prevent physical and environmental damage during transit and handling. All material not mounted or installed on the major equipment during shipping shall be properly crated and shipped with the associated equipment.

E. Draw-out circuit breakers shall be crated and shipped separately if recommended by the breaker vendor; otherwise, breakers shall be shipped within the system.

F. The Switchgear Manufacturer shall coordinate shipping of all equipment and material with the D&B Contractor.

G. Shipping sections shall be arranged to permit transport through limited-access routes as required.

H. The equipment shall be equipped for handling by crane, pallet jack, and rollers.

3.04 INSTALLATION

A. The Electrical Contractor shall provide labor for installation of the Double-Ended Substation switchgear system, plus all associated external power and control wiring. All rigging required for unloading and installation shall be the responsibility of the Electrical Contractor.

B. The switchgear shall be installed following the procedures set forth by the Switchgear Manufacturer. The Switchgear Manufacturer shall assist the Electrical Contractor as required in interpreting the installation instructions. The Electrical Contractor shall certify to the Switchgear Manufacturer and Owner that installation has been performed per the latest documents and instructions.

C. Following installation, the Switchgear Manufacturer shall inspect and verify the correct installation of the switchgear, including all individual components.

D. The D&B Contractor shall be responsible for the installation and connection of all interconnections of control and communication wiring between the equipment supplied for the facility, including:

1. Paralleling Switchgear (Section 16800)
2. Emergency generators and auxiliary equipment - day tanks, battery chargers, remote annunciators, etc. (Section 16900)
3. Double-Ended Substation (this Section)
4. SCADA computer/Building Management System
5. Automatic Transfer Switches (Section 16700)

3.05 FIELD SERVICE, START-UP, AND TRAINING REQUIREMENTS

A. The Switchgear Manufacturer shall provide a field service engineer for a pre-installation coordination meeting with the Electrical Contractor to coordinate installation and interconnection of the Double-Ended Substation switchgear system with the generators and paralleling switchgear.

B. The Switchgear Manufacturer shall provide a field engineer for an initial visit to check out the switchgear installation and permit energization of the main breakers, if required.

C. The Switchgear Manufacturer shall provide a field engineer for post-installation start-up and testing assistance prior to system turnover, including initial instruction and training for the facility's operating personnel. This visit shall include all service required to check out the complete switchgear system and demonstrate its full operation for final acceptance by the Owner.

D. At the time of system start-up, the Switchgear Manufacturer shall furnish two (2) preliminary sets of installation, operating, and maintenance manuals. At conclusion of site testing, the field engineer shall leave one (1) manual at the site, including all changes made during start-up; this amended manual shall serve as a reference until the final O&M manual sets, per Section 1.6 above, are supplied.

E. Instructions shall include recommended field test procedures per the applicable Standards, with a schedule of the frequency prescribed for performing field tests.

F. Approximately six (6) months after complete system turnover, the Switchgear Manufacturer shall make a follow-up visit to provide additional instruction to operating personnel on the complete operation and maintenance program for the Double-Ended Substation switchgear system.

END OF SECTION 16600

SECTION 16700 AUTOMATIC TRANSFER SWITCHES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Automatic Transfer Switches (ATS), with number of poles, amperage, and voltage as shown on Drawings, serving the four load categories of the facility's emergency and standby power system - Life Safety Branch, Critical Branch, Equipment System, and Optional Standby (Non-Essential) System - located in the Basement Main Electrical Room adjacent to the double-ended substation. Withstand and close-on ratings listed in this Section are minimum requirements; transfer switches furnished without UL-tested and labeled 3-cycle and 30-cycle ratings as detailed in Part 2 will not be reviewed or approved.

B. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16600 - Double-Ended Substation (normal source to each ATS)
3. Section 16800 - Paralleling Switchgear (emergency/generator source to each ATS)

1.02 REFERENCES

The Automatic Transfer Switches and associated controls shall conform to the requirements of the following codes and standards. Where conflicts exist among referenced codes and standards, the most stringent requirement shall govern.

A. Puerto Rico Building Code (PRBC), incorporating by reference the 2018 International Building Code (IBC) with Puerto Rico amendments, or the latest edition adopted in Puerto Rico at the time of permit application - governs seismic design and wind load (Category 5 hurricane, 180 mph design wind speed per ASCE 7/PRBC) anchorage requirements for the ATS enclosure and any associated housekeeping pad or wall/floor mounting.

B. NFPA 70 - National Electrical Code (NEC), latest edition adopted in Puerto Rico.

C. NFPA 99 - Health Care Facilities Code, latest edition - Essential Electrical System (EES) requirements for Category 1 facilities.

D. NFPA 110 - Standard for Emergency and Standby Power Systems.

E. NEC Article 517 (Health Care Facilities) and NEC Articles 700, 701, and 702 (Emergency Systems, Legally Required Standby Systems, and Optional Standby Systems, respectively).

F. UL 1008 - Underwriters Laboratories Standard for Transfer Switch Equipment.

G. UL 508 - Standard for Industrial Control Equipment.

H. ANSI/IEEE 446 - Recommended Practice for Emergency and Standby Power Systems for Commercial Applications.

I. NEMA ICS 10 P1 - Industrial Control and Systems, Part 1: Electromechanical AC Transfer Switch Equipment.

J. Electrical design documents and shop drawing submittals shall be prepared, reviewed, or endorsed under the responsible charge of a Professional Engineer licensed in the Commonwealth of Puerto Rico and in good standing with the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR), consistent with the project Bridging Document.

1.03 SUBMITTALS

A. Shop drawings for review, including as a minimum:

1. Descriptive literature.
2. Plan, elevation, side, and front view arrangement drawings, including overall dimensions, weights, and clearances, as well as mounting or anchoring requirements (including seismic anchorage per PRBC) and conduit entrance locations.
3. Schematic diagrams.
4. Wiring diagrams.
5. Accessory list.

B. Load calculation identifying the assignment of loads to each of the four load categories (Life Safety, Critical, Equipment System, Optional Standby) and any further subdivision within a category (e.g., a dedicated ATS per elevator or other major piece of equipment), per Bridging Document Section 6.2.

C. Factory test reports documenting UL 1008 3-cycle and 30-cycle close and withstand rating tests and post-endurance temperature rise tests; available upon request.

1.04 QUALITY ASSURANCE

A. ATS units shall be UL 1008 listed for the 3-cycle and 30-cycle close and withstand ratings specified in Part 2. Transfer switches furnished without UL 3-cycle and 30-cycle testing and labeling as detailed in this Section will not be reviewed or approved.

B. Manufacturer Qualifications: The transfer switch manufacturer shall employ a nationwide, factory-direct field service organization available on a 24-hour-a-day, 365-day-a-year call basis, with an 800-telephone number for field service contact affixed to the outside of each enclosure. The manufacturer shall maintain service records for each transfer switch, by serial number, for a minimum of 20 years.

C. Same-Manufacturer Coordination: Because the hospital's power system is monitored and controlled by a SCADA system, the transfer switch manufacturer shall

be the same manufacturer supplying the SCADA software, the diesel engine-driven generators (Section 16900), and the paralleling switchgear (Section 16800), to ensure proper functionality, coordination, and service.

D. Life Safety Branch and Critical Branch ATS units shall transfer to generator power within 10 seconds of loss of normal power, per NEC Article 700 and NFPA 99, respectively. This 10-second system-level transfer requirement is distinct from - and governs in addition to - the individual switch's minimum mechanical transfer speed specified in Part 2.

1.05 DESIGN REQUIREMENTS

A. A minimum of one ATS shall be provided for each of the four load categories: Life Safety Branch, Critical Branch, Equipment System, and Optional Standby (Non-Essential) System. Any category may be further subdivided into multiple ATS units serving individual loads or load groupings (e.g., a dedicated ATS per elevator or other major piece of equipment) as determined by the D&B Contractor's load calculation and equipment layout.

B. Separate ATS units shall be provided for the Life Safety Branch and the Critical Branch per NFPA 99 / NEC Article 517 - these two branches shall not be combined on a single ATS.

C. Number and Location: All ATS units, including any additional units serving a given load category, shall be located in the Basement Main Electrical Room adjacent to the double-ended substation. Downstream subdistribution from each ATS shall extend to floor electrical rooms as required to minimize feeder lengths and maintain branch separation per NFPA 99.

D. Equipment System and Optional Standby Subdivision: Large motor and large equipment loads may each be served by their own dedicated, individually sized ATS rather than a single shared ATS - large HVAC equipment such as chillers within the Optional Standby System, and elevators within the Equipment System category - allowing independent time-delayed starting/sequencing per piece of equipment and simplifying future load additions. Regardless of subdivision, time-delay contactors and sequencing controls shall be provided to prevent generator overload.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Automatic Transfer Switches shall be Russelectric, type RTSATA or RTSATB as indicated on Drawings, or other Owner-approved equal.

2.02 CONSTRUCTION - GENERAL

A. Transfer switches shall be electrically operated and mechanically held, with double throw construction.

1. On 3-phase, 4-wire systems utilizing ground fault protection, a true 4-pole switch shall be supplied with all four poles mounted on a common shaft. The continuous current rating and the closing and withstand rating of the fourth pole shall be identical to the rating of the main poles.
2. The transfer switch shall be mounted in a NEMA 1 enclosure, unless otherwise indicated, fabricated from 12-gauge steel, sized to exceed the minimum wire bending space required by UL 1008.
3. The transfer switch shall be equipped with an internal welded steel pocket housing an operations and maintenance manual.
4. The transfer switch shall be top and bottom accessible.
5. The main contacts shall be capable of being replaced without removing the main power cables, and shall be visible for inspection without major disassembly of the transfer switch.
6. All bolted bus connections shall have Belleville compression-type washers.
7. When a solid neutral is required, a fully rated bus bar with required AL/CU neutral lugs shall be provided.
8. Control components and wiring shall be front accessible. All control wires shall be multiconductor 18-gauge, 600-volt SIS switchboard-type point-to-point harness, with all control wire terminations identified by tubular sleeve-type markers.
9. The switch shall be equipped with 90 degree C rated copper/aluminum solderless mechanical-type lugs.
10. The complete transfer switch assembly shall be factory tested to ensure proper operation and compliance with the specification requirements. A copy of the factory test report shall be available upon request.
11. The ATS enclosure and mounting/anchoring provisions shall be designed and certified for the project's seismic and wind loads per the Puerto Rico Building Code (PRBC), including anchorage to the housekeeping pad or wall/floor mounting structure.

2.03 AUTOMATIC TRANSFER SWITCH MECHANISM

A. The transfer switch shall be double throw, actuated by one or two electric operators as indicated on Drawings, momentarily energized, and connected to the transfer mechanism by a simple over-center type linkage. Minimum transfer time (mechanical contact-to-contact transfer speed) shall be 400 milliseconds.

B. The normal and emergency contacts shall be positively interlocked mechanically and electrically to prevent simultaneous closing. Main contacts shall be mechanically locked in both the normal and emergency positions without the use of hooks, latches, magnets, or springs, and shall be silver-tungsten alloy. Separate

arcing contacts with magnetic blowouts shall be provided on all transfer switches. Interlocked, molded case circuit breakers or contactors are not acceptable.

C. The transfer switch shall be equipped with a safe external manual operator, designed to prevent injury to operating personnel, providing the same contact-to-contact transfer speed as the electrical operator to prevent a flashover from switching the main contacts slowly. The external manual operator shall be safely operated from outside the transfer switch enclosure while the enclosure door is closed.

2.04 TRANSFER SWITCH CONTROLLER

A. The transfer switch shall be equipped with a microprocessor controller with a power supply module, CPU, and I/O modules for all voltage and ampere ratings. The controller shall be capable of both serial and Ethernet communications.

B. The controller shall contain voltage sensing modules capable of direct single-phase or three-phase sensing of each source from 120 VAC to 600 VAC. The power supply module shall accept a 24 VDC external power source, allowing controller communications in the event of a power outage.

C. Voltage sensing shall be true RMS type, accurate to +/- 1% of nominal voltage. Frequency sensing shall be accurate to +/- 0.05 Hz. Operating temperature range shall be -20 to +50 degrees C, and storage range -40 to +90 degrees C.

D. The controller shall connect to the transfer switch through an interconnecting wiring harness. Interfacing relays shall be provided to isolate the controller from abnormal voltages applied to any and all customer input and output wiring terminals.

E. All customer interface connections shall be wired to a common DIN rail cage clamp terminal block, with sufficient space to allow for future modifications and upgrades.

F. The controller shall meet or exceed the following requirements for electromagnetic compatibility:

1. EN55022 (CISPR11) - Conducted and Radiated Emissions, Class B.
2. EN61000-4-2 (Level 4) ESD immunity test; ENG6100-4-3 (ENV50140) Radiated RF; EN61000-4-4 Electrical fast transient/burst immunity test; EN61000-4-5 IEEE C62.41 Surge immunity test; EN61000-4-6 (ENV50141) Conducted immunity test; EN61000-4-11 Voltage dips and interruption immunity.
3. IEEE 472 (ANSI C37.90A) Ring wave immunity.

2.05 CONTROLLER DISPLAY AND KEYPAD

A. A color, 1/4 VGA minimum, graphical display shall be provided for viewing data and setting operational parameters. Parameters shall also be available for viewing remotely and limited control through a front-accessible USB communications port.

B. The controller shall provide high-intensity LEDs for the following:

1. Source Availability - indicates the source voltage and frequency are within preset parameters.
2. Source Connected - indicates the source main contacts are closed and the load is being served from that source.
3. XFER Inhibit - indicates the ATS is being inhibited from automatic operation to the unconnected source.
4. Alarm - indicates an alarm condition is active.
5. TD Active - indicates that a transfer switch time delay is actively timing.

C. For ease of navigation, the display shall include: soft keys that change function based on user location in the menu structure; dedicated navigational keys (Home, Scroll Up, End, Escape, Enter); and dedicated pushbuttons for Alarm Reset, Test, Control, and Information.

2.06 VOLTAGE, FREQUENCY, AND PHASE ROTATION SENSING

A. Programmable voltage and frequency sensing of both sources, capable of detecting single- or three-phase losses, with adjustable pickup and dropout settings for each source. Minimum set point adjustment ranges shall be as follows: undervoltage dropout/trip 72 to 100% and pickup/reset 70 to 98% (N+E, 3-phase); overvoltage dropout/trip 100 to 108% and pickup/reset 102 to 110% (N+E, 3-phase); underfrequency dropout/trip 45.1 to 60.0 Hz and pickup/reset 45.0 to 59.9 Hz (N+E, 3-phase); overfrequency dropout/trip 50.0 to 69.7 Hz and pickup/reset 50.1 to 69.8 Hz (N+E, 3-phase).

B. The controller shall monitor phase rotation of both sources and inhibit transfer if both sources are not the same phase rotation (ABC or CBA).

C. Settings shall be adjustable in 1% increments via the keypad, USB port, or remotely via communications.

D. A single source status screen shall be provided to allow viewing of the status of both sources, including three-phase voltage, power, and frequency.

2.07 TIME DELAYS

A. An adjustable time delay of 0 to 10 seconds to momentarily override normal source power outages and to delay engine starting; expandable up to 60 minutes if an external 24 VDC power supply is provided for ATS control.

B. An adjustable 0 to 60 minute time delay on transfer to emergency, factory set at 3 seconds.

C. A time delay on retransfer to the preferred source, adjustable 0 to 259 minutes, factory set at 5 minutes.

D. A time delay on engine cool-down, adjustable 0 to 60 minutes, factory set at 5 minutes.

E. A timer to control the transition time from neutral to the non-preferred source, adjustable 0 to 10 minutes, factory set at 3 seconds.

F. As applicable, a timer to control the transition time from neutral to the preferred source, adjustable 0 to 10 minutes, factory set at 3 seconds.

G. All time delays shall be adjustable in 1-second increments, via the graphical display, the front USB port, or configuration software using the USB, serial, or Ethernet communications port.

2.08 ADDITIONAL CONTROLLER FEATURES

A. Test Switch: A two-position, password-protected test switch to simulate a normal source failure, configurable for Test Without Load or Test With Load functionality, activated via pushbutton on the display or remotely via dry contact, voltage signal, or network signal.

B. Engine Start Signal: An SPDT contact, rated 10 amps at 30 VDC, to start the engine generator upon normal source outage.

C. Source-connected contacts rated 10 amps at 120 VAC to signal when the ATS is connected to each source.

D. Source Connected LEDs indicating when the ATS is connected to each source.

E. Source Availability LEDs indicating the availability of each source.

F. Commit/No-Commit Transfer Selector: a programmable selector to configure whether the controller commits to transferring the load to emergency if the normal source returns before the generator is ready to accept load.

G. Inhibit Transfer Signals: capability to accept transfer control inputs that inhibit transfer of the ATS to either source.

H. Auto/Manual Selector: a programmable function to select either Automatic or Manual operation.

I. ATS/Engine Exerciser: a user-configurable exerciser, configurable for daily, 7-day, 14-day, or 28-day exercise periods each with up to 7 programmable events, or as a full 365-day exerciser with up to 24 independent exercise events. Each event shall be configurable for Test with Load and Test Without Load, with adjustable start time, date, and test duration, stored in non-volatile EEPROM memory, with full programmability for daylight savings time.

J. Diagnostics: self and system diagnostic screens for detecting and troubleshooting abnormal system events.

K. Communications Interface: serial/RS485 or optional Ethernet TCP/IP communications ports integral to the controller; all communications parameters (baud rate, parity, IP address, etc.) accessible and programmable via the front keypad. Both serial and Ethernet communications shall be Modbus open protocol.

L. Event Logger: capability to log data and maintain the last 256 events, even during a power failure, with time and date stamping accurate to 1 ms. The controller shall be capable of synchronizing its date/time setting with a main PC via Network Time Protocol over an Ethernet TCP/IP network connection. The following events shall be time and date stamped:

1. Last primary source failure.
2. Last reason for transfer.
3. Last transfer to alternate source.
4. Last retransfer to primary source.
5. Time load is without power.
6. Time ATS powered up.
7. Total time on Source 1.
8. Total time on Source 2.
9. Total number of primary source failures.
10. Total number of transfers.

M. Communications Modules:

1. Serial Communications: RS485 communications port enabling serial communications at baud rates up to and including 115.2 Kbps, user configurable, capable of direct connect or multi-drop network configuration.
2. Ethernet Communications: optional Ethernet TCP/IP communications via an internally mounted, self-powered communications card; 10/100 Mbit, auto-sensing, with RJ45 network connector.
3. Open Protocol: both serial and Ethernet communications shall be Modbus protocol; proprietary communications protocols are not acceptable.

N. External Power Supply: capability to connect to an external 24 VDC power supply to permit full operation and communications of the controller when both sources are de-energized.

O. Auto Load Shed: capability to be programmed to automatically shed the connected load upon a user-configurable underfrequency condition.

P. Customer Configurable Alarms: capability to display customer-configured alarm points, resettable via a remote contact or the front panel RESET pushbutton.

Q. Test Switch: key-operated, three-position test switch provided in the door, with Automatic, Load Test, and No-Load Test positions.

R. Motor Disconnect Switch: key-operated, two-position switch to disconnect the transfer switch motor, with Connect and Disconnect positions.

S. The Equipment System ATS units shall include programmable auxiliary contacts for use and coordination with the project's elevators.

2.09 POWER QUALITY METERING

A. The ATS shall be able to supply optional metering for current, voltage, real power, reactive power, energy use, power factor, and frequency. Metering shall be true RMS type, 1% accuracy for voltage and 0.5% for current, with a 5-amp secondary current transformer.

B. The following parameters shall be provided:

1. Phase current: Ia, Ib, Ic, In, and average current (Iavg).
2. Phase voltage: Va, Vb, Vc, Vab, Vac, Vbc.
3. Voltage and current unbalance.
4. Hz, PF, W, Var, VA.
5. Wh, VAh, VARh.
6. Voltage and current harmonics (% THD up to 8th order).
7. Phase rotation sensing.
8. Synchroscope (lead/lag).

C. The ATS shall be capable of monitoring and capturing waveform data during a utility power outage or other user-specified event:

1. A total of 10 active channels of waveform capture may be user configured.
2. Each channel shall be capable of capturing up to 256 cycles of waveform information.
3. Analog channels may be configured for 4, 8, 16, or 32 samples/cycle.
4. Digital channels shall be configured for 1 sample/cycle.
5. Waveform data shall be stored in industry-standard COMTRADE format.

D. The controller shall be capable of logging digital and analog measured parameters and storing the data in non-volatile memory, via a 10-channel data logger with each channel configurable to monitor a digital on/off or analog measured parameter, sampling rate configurable from 1 cycle to 60 minutes per sample, stored in non-volatile memory on a first-in, first-out basis.

2.10 WITHSTAND AND CLOSE RATINGS

A. The ATS shall be UL listed in accordance with UL 1008 for 3-cycle and 30-cycle close and withstand ratings. ATS units not tested and labeled for 3-cycle and 30-cycle ratings are not acceptable. Minimum UL-listed close and withstand ratings at 480 VAC (size in amps as shown on Drawings) shall be: 3-cycle rating 100 kA; 30-cycle rating 85 kA; current-limiting fuses 200,000 kA.

B. During 3-cycle and 30-cycle closing and withstand tests, there shall be no contact welding or damage. The 3-cycle and 30-cycle tests shall be performed without the use of current-limiting fuses. Tests shall verify that contact separation has not occurred and that contact continuity exists across all phases. Test procedures shall be performed in accordance with UL 1008, and testing shall be certified by Underwriters Laboratories, Inc.

C. When conducting temperature rise tests to UL 1008, the manufacturer shall include post-endurance temperature rise tests to verify the ability of the ATS to carry full rated current after completing the overload and endurance tests.

2.11 SYSTEM INPUTS AND TRANSFER TIME

A. Type: Open-transition (break-before-make) transfer switches, furnished with an external manual operator; 4-pole (switched neutral) construction where a neutral conductor is required.

B. Inputs: Each ATS shall have a normal-source input fed from its corresponding load-category breaker/subfeed at the double-ended substation distribution sections (Section 16600) and an emergency-source input fed from its corresponding distribution breaker/subfeed at the generator paralleling switchgear (Section 16800).

C. System Transfer Time: Life Safety Branch and Critical Branch ATS units shall transfer to generator power within 10 seconds of loss of normal power, per NEC Article 700 and NFPA 99, respectively - in addition to meeting the 400-millisecond minimum mechanical contact transfer speed of Article 2.03.

D. Controls: Time-delay-on-transfer, time-delay-on-retransfer, voltage/frequency sensing on both sources, and exercise/test controls, per Articles 2.06 through 2.08; BMS integration for source status, position, and alarm reporting.

PART 3 - EXECUTION

3.01 EXAMINATION

Verify the Basement Main Electrical Room housekeeping pad and both normal and emergency source feeder terminations are complete before setting ATS equipment.

3.02 INSTALLATION

A. Automatic Transfer Switches shall be provided with adequate lifting means for ease of installation of wall- or floor-mounted enclosures.

B. Provide access and working space as indicated or required.

C. Install and connect each ATS per the approved shop drawings and load assignment schedule; set time-delay and sequencing controls per the coordinated generator load-add/load-shed scheme (Section 16800).

D. Anchor each ATS enclosure to its housekeeping pad or wall/floor mounting structure in accordance with the manufacturer's certified seismic anchorage details and the Puerto Rico Building Code.

3.03 FIELD QUALITY CONTROL

Functionally test each ATS for correct transfer time, retransfer time delay, and voltage/frequency sensing, under simulated loss-of-normal-power conditions, prior to Substantial Completion; verify Life Safety Branch and Critical Branch ATS units transfer within 10 seconds. Document all test results.

END OF SECTION 16700

SECTION 16742 TELEPHONE AND DATA RACEWAY SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: A complete empty telephone/data raceway (pathway) system only, comprising the Main Telecommunications Room (MTR), floor-level Telecommunications Rooms (TRs), plywood backboards, main and branch conduits, backbone and horizontal cable trays, sleeves, supports, pull boxes, and outlet boxes with pull-strings/pull cords, sized and routed per ANSI/TIA-569 (Pathways and Spaces) to accommodate the Owner's future structured cabling installation. This Section covers rough-in infrastructure (pathways, conduit, cable tray, and room/space provisioning) only.

B. Work Not Included: The following are NOT in the D&B Contractor's Contract scope under this Section and shall be furnished and installed under a separate Owner contract by the Owner's structured cabling contractor:

1. Structured cabling itself, including all copper (UTP/F-UTP) horizontal cable, fiber optic backbone cable, and coaxial (CATV) cable.
2. Cable terminations, outlet jacks, faceplates, patch panels, cross-connects, and cable labeling/testing.
3. Active telecommunications and network equipment, including network switches, routers, wireless access point (WAP) units, and other rack-mounted equipment within the MTR and TRs.
4. Racks, cabinets, and equipment mounting hardware within the MTR and TRs (room and pathway provisioning only is provided under this Section; rack/equipment installation is by the Owner's structured cabling contractor).

C. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods.
2. Section 16112 - Raceways and Conduits.
3. Section 16131 - Outlet, Pull, and Junction Boxes.

1.02 REFERENCES

NFPA 70 (National Electrical Code), latest edition adopted in Puerto Rico; Puerto Rico Building Code (PRBC), incorporating the 2018 International Building Code (IBC) and 2018 International Fire Code (IFC) with Puerto Rico amendments; ANSI/TIA-569 (Telecommunications Pathways and Spaces); ANSI/TIA-568 (Generic Telecommunications Cabling for Customer Premises, referenced as the basis for pathway and outlet sizing only); ASCE 7 (wind loads); NFPA 99 (Health Care Facilities Code); requirements of the Junta Reglamentadora de Telecomunicaciones de Puerto Rico (JRTC).

1.03 SUBMITTALS

A. Submit for review properly identified product data for conduit, cable tray, backboards, sleeves, pull boxes, and outlet boxes, giving materials, finishes, accessories, and installation requirements.

B. Submit coordination drawings for the MTR and each TR showing room dimensions, backboard layout, cable tray and conduit entries, and pathway capacity, coordinated with the Owner's structured cabling contractor's rack, cabinet, and equipment layout requirements.

C. Furnish a set of "Record Drawings" to the A/E indicating accurate plan layout, conduit and cable tray routing, pull box locations, and TR/MTR room layouts as installed.

D. Submit documentation of the JRTC (Junta Reglamentadora de Telecomunicaciones de Puerto Rico) endorsement of the telecommunications point of connection, together with JRTC-endorsed drawings, prior to commencing telecommunications rough-in work at the point of connection.

1.04 QUALITY ASSURANCE

Install materials according to local and national codes and per ANSI/TIA-569. Coordinate the size, routing, and capacity of all pathways, conduits, and cable trays furnished under this Section with the Owner's structured cabling contractor so that the empty raceway system will accommodate the intended Category 6A (10 GbE-capable) horizontal cabling and fiber optic backbone cabling, even though that cabling is furnished and installed by others. Obtain JRTC endorsement of the telecommunications point of connection, with JRTC-endorsed drawings, prior to commencing telecommunications work at that point of connection.

1.05 DESIGN REQUIREMENTS

A. Main Telecommunications Room (MTR): Provide room and pathway provisioning for the MTR in the Basement near the Main Electrical Room, serving as the building's main point of entry for external telecommunications services (internet, telephone, and private fiber from the ASEM Central Services Building). Rack and equipment installation within the MTR is by the Owner's structured cabling contractor.

B. Point of Connection: Coordinate the preliminary point of connection at the manhole located north of the project site; final point of connection and service requirements shall be as determined by JRTC. Coordinate evaluation and endorsement of the connection with the corresponding telecommunications service provider/agency.

C. Telecommunications Rooms (TRs): Provide a minimum of one (1) TR per floor, consistent with the two-electrical-rooms-per-floor arrangement, with additional TRs provided as necessary so that no horizontal cable run from a TR termination point to any wall outlet will exceed the 292 ft maximum cable distance required for Ethernet cabling. Size each TR per ANSI/TIA-569 with adequate power, cooling (dedicated mini-split or served by HVAC), and UPS-backed power provisions; room provisioning,

sizing, and pathway connections only are provided under this Section — patch panels, network switches, and other active equipment are furnished and installed by the Owner's structured cabling contractor.

D. Minimum 10% spare capacity per Section 16100, Section 1.4.A shall be maintained in conduit and cable tray fill capacity for future load growth.

PART 2 - PRODUCTS

2.01 TELEPHONE/DATA RACEWAY SYSTEM

A. Extend main raceway conduits from the Main Telecommunications Room (MTR) to the point of connection at the underground telecommunications utilities system. The pathway system shall be complete, empty, and continuous from the site point of connection, via main raceway conduits and the MTR, and branch conduit to final telephone/data outlet locations, ready to receive the Owner's structured cabling.

B. Extend riser conduits and/or backbone cable tray from the MTR to each floor-level Telecommunications Room (TR).

C. Provide a minimum of 3 conduits (or equivalent cable tray capacity) between the MTR and each TR.

D. Refer to the telephone/data riser diagrams shown on the Drawings.

E. Branch conduits to final telephone/data outlet locations from the MTR or TRs shall be 3/4" minimum and not exceed a length of 250 feet.

F. Furnish and install necessary interior conduit, sleeves, strip cabinets, pull boxes, outlet boxes, and other materials for a complete empty conduit pathway system for telephone/data as shown on the Drawings. Structured cabling, terminations, and outlet jacks are not included; see Section 1.1.B.

G. Install conduit in accordance with Section 16112 - Raceways and Conduits.

H. Provide pull wires (pull-strings/pull cords) in all empty conduits, with a minimum 10 inches of slack at each end.

I. Where junction boxes are used to distribute the 3/4" conduit runs, the conduit(s) feeding the junction box shall be sized as specified in Section 16112.

J. Raceways shall contain not more than two 90-degree bends or the equivalent. Provide additional junction or pull boxes to meet this requirement.

2.02 CABLE TRAYS

A. Backbone Cable Tray: Provide ladder-type cable tray from the MTR to each TR, sized to accommodate fiber optic backbone pathway capacity for both data (hospital network) and telephone/voice systems. Ladder-type cable tray shall be used generally within mechanical/electrical rooms and MTR/TR-to-TR backbone runs.

B. Horizontal Cable Tray: Provide cable tray above ceilings, of wire basket type in patient care areas, sized to accommodate Category 6A (10 GbE-capable) UTP/F-UTP horizontal pathway capacity from each TR to all data/voice outlet locations, with EMT conduit stub-outs in walls to the outlet boxes.

C. Wireless Access Point (WAP) Pathway: Provide homerun conduit and/or cable tray pathway from the nearest TR to each coordinated WAP location; final WAP quantity and placement is by the Owner's wireless network contractor, but rough-in pathway shall be coordinated and provided under this Section.

D. Cable tray shall not pass through electrical rooms or fire-rated barriers without proper fire-stopping at each penetration.

E. Cable trays and all associated supports shall be bonded and grounded continuously per Section 16112 and Article 3.1 of this Section.

F. Support cable tray independently of ceiling grid and other trades' work at intervals per manufacturer's recommendations and structural requirements.

2.03 BACKBOARDS

A. MTR and TRs: Cover walls as indicated on the Drawings with 3/4" plywood, painted with gray fire-retardant paint.

B. Terminate telephone/data conduits at the top and bottom of the backboards.

2.04 FLOOR SLEEVES

A. Extend 6 inches above and below the slab construction at the MTR and each TR.

B. Provide 4-inch sleeves at above-grade TRs unless noted otherwise.

C. Provide iron pull eyes at ceiling slabs of the MTR and TRs for cable-pulling by the Owner's structured cabling contractor.

2.05 OUTLET BOXES

A. Wall Telephone/Data Outlet Boxes:

    a. 4-inch boxes with single-gang mud ring and EMT stub-out/pathway to the nearest accessible cable tray. Faceplates and jacks are furnished and installed by the Owner's structured cabling contractor; see Section 1.1.B.

B. Floor Telephone/Data Outlet Boxes:

    a. Provide a separate 4-inch box for each telephone/data position.

    b. Telephone/data floor outlet boxes shall have a mounting frame suitable for a duplex device opening, a brass cover with brass screws, and 2 hinged lids to allow the use of either or both openings; Walker 828R or accepted equivalent.

c. Do not connect more than 2 floor outlet boxes together. Provide one 1-1/4" conduit from the TR to feed a pair of floor outlets.

C. Outlet Rough-In Density: Provide outlet boxes and conduit stub-outs for a minimum of two (2) data/voice outlet locations per patient room, per workstation, and per nursing station location, with additional locations at imaging, operating rooms, and other special areas per the program, as shown on the Drawings.

D. Cable TV (CATV) Rough-In: Provide outlet boxes and conduit stub-outs for CATV provisioning at waiting areas and patient rooms as shown on the Drawings. Coaxial cabling, splitters/taps, and active CATV head-end equipment are not included; see Section 1.1.B.

2.06 SERVICE ENTRANCE CONDUIT

A. Underground: PVC, Schedule 40.

B. Aboveground: Rigid metallic.

2.07 HURRICANE AND SEISMIC REQUIREMENTS

B. Seismic Isolation Plane: All conduits and cable trays of this Section crossing the building's seismic isolation plane at the Interstitial Level shall use flexible connections/seismic loops to accommodate differential movement, coordinated with the building's seismic isolation system design.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install materials according to local and national codes and per ANSI/TIA-569.

B. Conduit from branch telephone/data outlets shall terminate at the top and bottom of the backboard unless indicated otherwise. Provide empty conduit with suitable pull wires. Allow 10 inches minimum slack at each end of pull wire.

C. Bury underground conduit a minimum of 24 inches below finish grade.

D. As indicated on the Drawings, provide an insulated No. 6 AWG grounding wire terminated on a grounding bar in the MTR and each TR, bonded to the building grounding system per Section 16112.

E. Ensure the empty raceway/pathway system installed for telephone, data, and spares is clearly marked and is not used for any other purpose.

F. Mount wall telephone/data outlets in one outlet box at 18 inches above finish floor, unless otherwise shown on the Drawings.

G. Mount telephone and data outlets as shown on the Drawings.

H. Provide fire-stopping at every cable tray and conduit penetration of a fire-rated barrier or electrical room wall/floor, per the fire-stopping system's listing.

3.02 COORDINATION

A. Coordinate MTR and TR room layout, backboard placement, and pathway entries with the Owner's structured cabling contractor prior to rough-in, so that the empty raceway system will accommodate the intended cabling without modification.

B. Coordinate the point of connection and any exterior work with the telecommunications service provider/agency and obtain JRTC endorsement, per Section 1.3.D, prior to commencing that work.

3.03 FIELD QUALITY CONTROL

A. Pull-test (mandrel test) all empty conduits after installation to verify a clear, unobstructed pathway free of debris and deformation.

B. Verify continuity and resistance of the grounding/bonding system for the raceway and cable tray system prior to close-in.

C. Verify no cable tray or conduit fill exceeds the capacity coordinated with the Owner's structured cabling contractor under Section 3.2.A.

END OF SECTION 16742

SECTION 16800 PARALLELING SWITCHGEAR

PART 1 - GENERAL

1.01 SUMMARY

A. This Section describes all labor, materials, equipment, and services necessary for and incidental to furnishing, installing, and testing the newly manufactured paralleling switchgear and generator control system that synchronizes and parallels the three (3) emergency diesel generator sets specified in Section 16900 onto a common bus and distributes generator power to the Essential Electrical System (EES) and Optional Standby Automatic Transfer Switches specified in Section 16700. The paralleling switchgear assembly shall be located in a dedicated room, separate from and adjacent to the Generator Room, as further described in Article 1.4 below.

B. The Switchgear Manufacturer shall manufacture and furnish all equipment described in this Section with a practical layout consistent with good engineering design practice and allowance for future expansion capability. The Switchgear Manufacturer's scope of work shall also include factory testing and comprehensive system site start-up and testing.

C. Related Sections:

1. Section 16100 - Basic Electrical Materials and Methods
2. Section 16600 - Double-Ended Substation (separate, related normal-power system; the double-ended substation's distribution sections provide the normal-source input to the same Automatic Transfer Switches fed on their emergency-source side by this Section's distribution breakers)
3. Section 16700 - Automatic Transfer Switches
4. Section 16900 - Diesel Engine-Driven Generators

1.02 REFERENCE STANDARDS

A. The design, equipment, installation, and testing shall be in strict accordance with the applicable requirements of ANSI, UL, IEEE, and NEMA, and with NFPA 99 and NEC Articles 517, 700, and 702 as adopted in Puerto Rico.

B. The generator switchgear construction, including all internal mounted components, shall be listed and labeled under UL Standard 1558 with a bus withstand rating of 100,000 amperes symmetrical for four (4) cycles minimum, at the time of bid opening. Manufacturers submitting equipment line-ups without UL 1558 listing and labeling with this withstand rating, prior to bid opening, shall not be accepted.

C. The entire paralleling switchgear system, including all controls, breakers, buswork, and components, shall be completely manufactured and assembled by a single manufacturer and shall be UL listed and labeled under that manufacturer's name.

D. All equipment and material supplied shall comply with the latest edition and amendments, as adopted by the AHJ in Puerto Rico, of the following standards and codes:

1. IEEE C37.20.1 - Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
2. ANSI C37.50 - Low Voltage AC Power Circuit Breakers Used in Enclosures; Test Procedures
3. ANSI C37.51 - Metal-Enclosed Low Voltage AC Power Circuit Breaker Switchgear Assemblies Conformance Testing Procedures
4. IEEE C37.13 - Standard for Low Voltage AC Power Circuit Breakers
5. ANSI/IEEE C12 - Code for Electric Metering
6. ANSI/IEEE C39.1 - Requirements for Electrical Analog Indicating Instruments
7. ANSI C57.13 - Requirements for Instrument Transformers
8. FS W-C-375 - Circuit Breakers, Molded Case, Branch Circuit and Service
9. FS W-F-370 - Fuseholders (For Plug and Enclosed Cartridge Fuses)
10. NEMA SG3 - Power Switching Equipment
11. NEMA AB 1 - Molded Case Circuit Breakers
12. NEMA KS 1 - Enclosed Switches
13. NEMA ICS 1 - General Standards for Industrial Control and Systems
14. NEMA PB 2 - Dead Front Distribution Switchboards
15. NEMA PB 2.1 - Instructions for Safe Handling, Installation, Operation, and Maintenance of Dead Front Distribution Switchboards Rated 600 Volts or Less
16. NFPA 70 - National Electrical Code (NEC)
17. NFPA 110 - Standard for Emergency and Standby Power Systems (Level 1, Type 10, Class per the generator fuel reserve specified in Section 16900)
18. NFPA 99 - Health Care Facilities Code
19. Underwriters Laboratories UL 1558; IEEE C37.2 (protective relay device numbers); IEEE 242 (protective relay coordination)
20. Federal, Commonwealth of Puerto Rico, and local codes and amendments, including the Puerto Rico Building Code

1.03 STRUCTURAL AND SEISMIC PERFORMANCE REQUIREMENTS

A. The low-voltage paralleling switchgear shall have a seismic certification, based on shaker table testing, certified in accordance with the International Building Code (IBC) as adopted by the Puerto Rico Building Code, ASCE 7, and ICC-ES AC156, with Sds = 2.0 g or greater, appropriate to this project's Puerto Rico seismic design category. (Certification to an unrelated jurisdiction's building code, such as the

California Building Code, is not applicable to this project and shall not be substituted.)

B. Enclosures, hardware, and finishes shall be suitable for the ambient humidity and coastal/hurricane-exposed environment of Puerto Rico consistent with the indoor installation described in Article 1.4; painted finishes shall meet the corrosion-resistance requirement of Article 2.8.C.

1.04 SWITCHGEAR ROOM REQUIREMENTS

A. The paralleling switchgear assembly shall be located in a separate room of two-hour fire-rated construction, adjacent to, but not within, the Generator Room specified in Section 16900. The Switchgear Manufacturer shall coordinate equipment dimensions, access/egress, ventilation, and housekeeping-pad layout with this room configuration.

B. Verify the paralleling switchgear room is complete (two-hour fire-rated construction, ventilated, concrete housekeeping pad in place) and physically separate from the Generator Room before equipment is set; see Article 3.4.

1.05 SWITCHGEAR MANUFACTURER QUALIFICATIONS

A. It is the intent of the Owner to receive bids only from domestic manufacturers who provide competent engineering, manufacturing, production, testing, and field services to manufacture and provide a highly reliable, fully integrated, state-of-the-art critical power switchgear system that can be successfully supported by the Switchgear and Controls Manufacturer over the lifetime of the system. Qualified bidders shall meet the following requirements and provide the necessary supporting documentation; failure to provide this documentation shall be considered a non-responsive bid and shall result in bid disqualification.

B. The manufacturer shall have at least twenty (20) years of experience in the design, manufacturing, and support of generator paralleling switchgear and automatic transfer switches, and shall have at least twenty (20) similar successful installations in Puerto Rico.

C. The switchgear manufacturer shall have trained, factory-employed field service personnel on staff for installation support, start-up, and ongoing field support for the life of the system; the manufacturer shall not subcontract field service work or personnel. A 24-hour, toll-free hotline with a guaranteed call-back response within one (1) hour from a qualified factory technician, with a proven history of response, shall be in place at the time of bid.

D. Any manufacturer wishing to limit the number and type of field service visits included for start-up of this equipment shall state so in the bid, and shall provide published field service rates, including overtime and holiday rates, for additional visits, for bid evaluation purposes.

1.06 SUBMITTALS

A. Bid Submittal shall include: submittal and equipment lead time; warranty statement; terms and conditions; detailed bill of material; and physical elevation drawings.

B. Approval Submittal: the Switchgear Manufacturer shall furnish a submittal with adequate information to fully define the system offered, including:

1. A one-line diagram clearly indicating the functional relationship between equipment.
2. Outline drawings showing plan and elevation views of each piece of equipment, including size, weight, dimensions and weight of shipping splits, and typical conduit entry areas.
3. Detailed cubicle front-view and equipment door detail drawings showing all meter, annunciator, and control device locations with nameplate legends and required nameplate information.
4. Base plans for equipment floor channels, anchor bolts, and conduit entrance spaces.
5. Catalog data sheets for all circuit breakers and protective devices.
6. Short-circuit rating of bus, and interrupting and withstand ratings of breakers.
7. Detailed bill of material indicating long-lead items to be released first.
8. System delivery schedule.
9. Proposed sequence of operation for the entire system.
10. A statement listing all deviations and/or exceptions to this Specification.

C. Two copies of the reviewed submittal, approved and stamped by the consulting engineer, will be returned to the Switchgear Manufacturer for production release.

D. Protective relay coordination study for the generator breakers, bus, and distribution breakers, per IEEE C37.2 and NFPA 110, coordinated with Section 16700.

E. Synchronizing, load-sharing, and load-shed/load-add control sequence, coordinated with the generator controls of Section 16900.

1.07 OPERATION AND INSTRUCTION MANUALS

A. The Switchgear Manufacturer shall submit one complete hard copy and two digital copies of O&M manuals within two weeks after conclusion of equipment start-up and final acceptance. These manuals shall include, but not be limited to:

1. Detailed operating and maintenance instructions.
2. Approved "As-Built" shop drawing information updated to "As-Installed," including all field modifications.
3. Assembly splice-plate details for interconnection of shipping sections.

4. Wiring diagrams for each breaker, switch, etc., with all terminal markings and connections for other circuits.
5. Internal connection diagrams of relays, instruments, and control switches.
6. Complete parts list identifying manufacturer and type or model number for all principal parts.
7. Recommended spare parts list, with pricing, for one year of operation.
8. Hard copy of the equipment PLC program, bound separately.
9. Complete system interconnect diagrams.

B. The manufacturer shall offer an optional, comprehensive preventive maintenance program.

C. A complete set of O&M manuals shall be delivered to the Owner prior to training of Owner personnel.

D. O&M manuals shall contain 100% accurate "As-Installed" drawings, interconnect diagrams, schematic diagrams, wiring diagrams, component manuals, operating procedures, a system description with theory of operation, maintenance schedules and procedures, original programmed settings and parameters, and all other information necessary for the Owner to maintain, operate, test, and troubleshoot the system.

E. O&M manuals shall not rely solely on sub-component manuals; a thorough consolidation of operation and maintenance information shall be provided in a system overview guide covering all major components, including breakers, synchronizers, generator cubicle controls, genset controls, the PLC, the Operator Interface Panel (OIP), and the Master Cubicle.

1.08 WARRANTY

The Manufacturer shall provide a comprehensive two-year warranty covering all parts and labor to repair or replace any defect appearing within the two-year period from date of shipment. All parts, labor, and transportation costs to remedy any defect or non-compliance with the Contract Documents shall be provided by the Manufacturer at no cost to the Owner.

1.09 DESIGN REQUIREMENTS - GENERATOR PARALLELING AND DISTRIBUTION CONFIGURATION

A. The three (3) emergency diesel generators specified in Section 16900 shall connect to this dedicated paralleling switchgear assembly, which shall synchronize and parallel the three generators onto a single common bus, then distribute generator power to eleven (11) separate distribution breakers, as follows, per the Bridging Document Section 6.1.2:

1. One (1) distribution breaker feeding the emergency-source input of the Life Safety Branch ATS(s) (Section 16700).
2. One (1) distribution breaker feeding the emergency-source input of the Critical Branch ATS(s) (Section 16700).
3. Two (2) distribution breakers feeding the emergency-source input of the Equipment System ATS(s) (Section 16700).
4. Six (6) distribution breakers feeding the emergency-source input of the Optional Standby (Non-Essential) ATS(s) (Section 16700), governed by NEC Article 702.
5. One (1) dedicated load bank breaker for periodic generator load testing per NFPA 110.

B. The first four categories above (Life Safety, Critical, Equipment System, and Optional Standby) total ten (10) distribution breakers serving the three NFPA 99 Essential Electrical System (EES) branches (Life Safety, Critical, and Equipment System) and the Optional Standby (Non-Essential) system; together with the one (1) load bank breaker, this yields the eleven (11) total distribution breakers required.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

Subject to compliance with the requirements specified herein, the Basis of Design manufacturer is Russelectric, or other Owner-approved equal.

2.02 SYSTEM OVERVIEW

A. Furnish the generator control and distribution switchgear, arranged to control the operation and distribution of power for three (3) diesel generator sets, each rated 1,750 kW / 2,187 kVA, 277/480 V, 0.8 PF, 2,634 A FLA, 60 Hz, matching the generator ratings of Section 16900.

B. The emergency generator paralleling switchgear shall be 3-phase, 4-wire construction.

C. The switchgear shall be arranged for fully automatic or manual operation at the operator's discretion. The system shall provide safe manual operation completely independent of the automatic PLC system and the OIP/computer-based control system, using hard-wired interlocks, instruments, and control switches. Systems that provide redundant PLCs, computers, or operator interface panels/HMIs as the sole means of back-up manual operation are unacceptable. Each section shall include the AC instrumentation, relaying, pilot lights, selector switches, and accessories required to manually start/stop the engine generators, synchronize the

generators, and control all circuit breaker operations, and shall include provisions to mount and wire the engine/generator voltage regulator and/or governor control equipment supplied by the engine generator vendor.

D. All control voltage for auxiliary relays, circuit breakers, synchronizing, and other automatic equipment shall be obtained from the emergency generators and the engine starting batteries.

2.03 SEQUENCE OF OPERATION

A. All system operation and control functions shall be coordinated and integrated so that during automatic and/or manual operation no unsafe condition or malfunction of intended operation shall occur, and the highest possible reliability of operation shall be maintained.

B. Coordinate and integrate the functions and circuitry of all selector switches to ensure the various available settings do not cause a malfunction of the intended system operation.

C. Automatic Start Sequence: provide interconnecting control circuits to produce the following normal operating function when a system start command is given:

1. Upon receipt of a start signal, start all diesel generators.
2. Close the generator output circuit breaker for the first generator to reach 90% operating voltage and 58 Hz frequency; any generator may be first to close to the bus, independent of the others. Systems that sequentially select which generator may close to the bus, or that rely on timers to select the closing generator, are not acceptable.
3. Once the next diesel (randomly selected) reaches operating voltage and frequency, it shall synchronize to the on-line unit(s) and close into the bus.
4. In like manner, each generator shall synchronize to the on-line units and close into the bus, independent of the other units, until all available units are on the bus.
5. Provide positive lockout so that no two engine generators can be connected to a dead bus simultaneously.
6. Upon receipt of a stop signal, all individual generator circuit breakers shall open and the engine generators shall continue to run at no load for an adjustable cool-down period (0-56 minutes) before complete shutdown.

D. Utility Power Failure Sequence: provide interconnecting control circuits to produce the following normal operating function when a utility power failure occurs:

1. Upon utility power failure, sensed by the Automatic Transfer Switches (ATS), a signal shall be sent to the paralleling switchgear, initiating an automatic start sequence of all emergency engine generators.

2. The first generator to close to the emergency bus shall cause the Priority #1 ATSs to transfer to the emergency system (Priority #1 loads sized not to exceed the full-load capacity of any one generator). The remaining generators shall automatically parallel when in synchronism; as each is added to the bus, pilot contacts shall initiate load control circuits to transfer Priority #2 and #3 ATSs to the emergency bus. Failure of any generator while operating in automatic mode shall initiate load-shedding control, if necessary, to reduce total load to the capacity of the remaining generator(s) by shedding Priority #3 through #2 in reverse order of load addition.
3. If the first generator to achieve 90% rated voltage and 58 Hz fails to close to the bus, dead-bus closure logic shall immediately allow another generator running at proper voltage and frequency to close to the bus; the generator that failed to close shall continue attempting to synchronize for a period set by the fail-to-synchronize timer.
4. When utility power returns and all ATSs have transferred back to normal after their individual adjustable time delays, the generator circuit breakers shall open and the engines shall run unloaded through their cool-down cycle (adjustable 0-56 minutes).

2.04 LOAD CONTROL CIRCUITS

A. Provide control circuits, interlocks, and relays to protect against overloading.

B. The OIP shall include a load control screen allowing an operator to select individual loads and assign load kW values and load priority levels, with sub-priorities (1.1, 1.2, 1.3… within priority 1; 2.1, 2.2, 2.3… within priority 2, etc.) and individually adjustable time delays to sequence loads within a priority group.

C. Load-shedding controls shall be backed up by a bus frequency monitor that sheds all non-essential loads during a bus under-frequency condition.

D. A means to initiate load-shed bypass and permit supervised manual addition of shed loads shall be provided on the master control cubicle door or the OIP, to allow manual disabling of the load-shedding logic (except during an under-frequency condition).

2.05 CIRCUIT BREAKERS - GENERAL

A. All circuit breakers shall be electrically operated, 3-pole, draw-out type (Basis of Design: Siemens type WL, or equal), provided with self-aligning line-side and load-side disconnecting devices; breakers of the same rating shall be interchangeable, and each shall be equipped with a stored-energy operating mechanism.

B. Circuit breakers shall be rated nominal 508 VAC, 3-phase, 60 Hz, with minimum interrupting rating of 100,000 A symmetrical (100 kAIC); continuous current rating as indicated on the contract drawings/Article 1.9; rated dielectric strength per ANSI C37.04 and C37.06 for this voltage class.

C. Trip units shall be adjustable Long-Time, Short-Time, and Instantaneous overcurrent, with adjustable ground fault (LSIA), internally sensor-powered, with individual dials and adjustable rating plugs; the trip unit shall be powered by the system DC power supply to maintain power to the trip unit display at all times.

D. Each circuit breaker shall have an arc-reduction mode selector switch on the breaker door, illuminating blue when arc reduction mode (providing arc reduction downstream of the breaker) is selected; the OIP shall annunciate and alarm when a breaker is in arc-reduction mode, and shall re-alarm after an adjustable time if the switch remains active after being silenced.

E. Trip units shall include a 1.5%-accuracy digital ammeter with LCD display and Modbus communication to remote systems; current information shall also be viewable on the OIP by selecting the breaker on the single-line screen. Breakers shall include a full metering trip unit.

F. Operating mechanism: stored energy, maximum 5-cycle closing time; control voltage 24 VDC; trip and 120 VAC close/charge.

G. Provide auxiliary contacts, interlocks, and relays as required, plus four (4) spare auxiliary contacts (two "a" and two "b") in addition to those required for control, alarm, and interlocking functions.

H. Interchangeability per ANSI C37.20; controls shall function in both OPERATE and TEST positions; breaker control wiring per ANSI C37.11 with separate fusing of close and trip circuits.

I. Provide means for integral manual tripping and closing of breakers. All synchronizing circuit breakers shall have manual close defeat covers installed.

J. Provide mechanical interlock to prevent removal or insertion of a breaker while in the closed position, and an interlock that automatically discharges closing springs upon removal from or insertion into the compartment.

K. Accessories: hand-held, full-function trip unit tester; switchgear overhead lift device or portable circuit breaker lift.

2.06 DISTRIBUTION BREAKERS - LIFE SAFETY BRANCH

One (1) electrically operated, draw-out, UL 1066 circuit breaker rated 100 kAIC at 480 VAC, with adjustable overcurrent and short-circuit trip, feeding the emergency-source input of the Life Safety Branch ATS(s) (Section 16700), per Article 1.9.

2.07 DISTRIBUTION BREAKERS - CRITICAL BRANCH

One (1) electrically operated, draw-out, UL 1066 circuit breaker rated 100 kAIC at 480 VAC, with adjustable overcurrent and short-circuit trip, feeding the emergency-source input of the Critical Branch ATS(s) (Section 16700), per Article 1.9.

2.08 DISTRIBUTION BREAKERS - EQUIPMENT SYSTEM

Two (2) electrically operated, draw-out, UL 1066 circuit breakers rated 100 kAIC at 480 VAC, with adjustable overcurrent and short-circuit trip, feeding the emergency-source input of the Equipment System ATS(s) (Section 16700), per Article 1.9.

2.09 DISTRIBUTION BREAKERS - OPTIONAL STANDBY (NON-ESSENTIAL)

Six (6) electrically operated, draw-out, UL 1066 circuit breakers rated 100 kAIC at 480 VAC, with adjustable overcurrent and short-circuit trip, feeding the emergency-source input of the Optional Standby ATS(s) (Section 16700). This branch is governed by NEC Article 702 and is distinct from the three NFPA 99 EES branches above; it serves non-essential building loads (e.g., general office, food service, non-clinical support areas) that the Owner has elected to place on generator backup, per Article 1.9.

2.10 LOAD BANK BREAKER

One (1) electrically operated, draw-out, UL 1066 circuit breaker dedicated to connection of a permanent or portable load bank, enabling periodic generator testing under load per NFPA 110, per Article 1.9.

2.11 BUS CONFIGURATION

Single common paralleling bus, rated for the full output of all three generators operating in parallel (3 x 1,750 kW); bus sized and braced for the available fault current with all three generators contributing, with a bus withstand rating of 100,000 A symmetrical for four cycles minimum per Article 1.2.B. Master cubicle, generator cubicle, and distribution cubicle bus sections each provide one set of three-phase, 10,000 A main bus, neutral bus, and separate ground bus, silver-plated copper throughout, per Article 2.14.D.

2.12 GENERATOR BREAKERS

One (1) electrically operated, draw-out or fixed-mount generator output breaker per generator (3 total; 3,200 A frame, 100 kAIC at 480 VAC, adjustable overcurrent and short-circuit trip), each with synchronizing controls, reverse power/loss-of-field protection (Basler drawout type BE1-32 reverse power relay, or equal), and interlocking to prevent out-of-phase paralleling.

2.13 CONTROL AND SAFETY DEVICES

A. Alarm Horn: station alarm horn and silencing circuit with indicating lamp, rated 88-90 decibels at 10 feet, sounding on malfunction; if silenced, receipt of another signal re-sounds the horn (Ring-Back); the horn resets automatically once the failed circuit is corrected.

B. Annunciator Alarm Ring-Back: all alarms shall be Ring-Back type - silencing the horn re-arms it to re-sound on the next alarm.

C. Automatic DC Control Voltage System: an automatic "best battery source" DC control system shall provide stable DC control voltage for all DC components, derived from each engine's starting battery through a best-battery-source selector, isolating each battery so a single battery failure cannot disable the system, and maintaining stable control voltage as long as any battery source is within 20% of nominal during engine operation. Each generator control cubicle shall have a dedicated DC-to-DC converter; the master cubicle shall have dedicated DC-to-DC converters for each PLC, for the OIP, and for the communications network devices. Each converter shall regulate output to a stable 24 VDC over an 18-32 VDC input range, with 6 ms hold-up time, 20% reserve capacity, overvoltage protection to 110% output, and minimum 90% efficiency. The master cubicle shall additionally have an independent, short-duration, regulated 24 VDC power source to maintain switchgear control voltage during engine cranking; an external priority 120 VAC supply shall be furnished by the Electrical Contractor.

D. Automatic Synchronizer: separate microprocessor-based synchronizers (Basis of Design: Woodward type SPM-D2-10, or equal) shall be provided for each generator, plus one dedicated to control generator bus synchronization, designed for three-phase AC generators with frequency, phase, and voltage matching control compatible with the engine governor. Each synchronizer shall have a two-line LCD display for operation, alarm indication, and generator/bus voltage and frequency values, all control adjustments and I/O terminals legibly marked, and an LED synchroscope with separate LEDs indicating raise/lower frequency and raise/lower excitation signaling to the governor. Control designs utilizing "on-board" engine paralleling control systems, or a single synchronizer switched between multiple generator sources, are not acceptable. Synchronizers shall operate over -20°C to +70°C ambient, 95% non-condensing humidity, and meet the dielectric and surge withstand capability of IEEE 472-1974/ANSI C37.

E. Back-lit LED Annunciation Panel: individual 1.575 in. x 1.575 in. square translucent windows with black-engraved 3/8 in. lettering indicating alarm/failure/status condition; plug-in LED indicators with dual-circuit design incorporating four redundant LED strings so a failed string does not render the lamp inoperative; a push-to-test button on each annunciated section.

F. Current Transformers: 0-5 ampere output, wound type, molded construction, single secondary winding, primary/secondary ratio as required, burden and accuracy consistent with connected metering and relay devices, rated 50-400 Hz, 600 V at 10 kV BIL full wave, built to ANSI/IEEE C57.13 and UL in accordance with IEC 44-1.

G. Engine Generator Control: engine starting shall be controlled by hot-standby, dual-redundant system PLCs in the master control section, using distributed I/O residing in each generator control cubicle with its own power supply, chassis, and I/O cards. If both PLCs or an I/O module fail, the system shall permit manual start/paralleling. Programming is the responsibility of the switchgear manufacturer. A fail-to-synchronize time delay (adjustable 30-180 seconds) shall terminate synchronizer

operation and sound a warning horn if a generator cannot synchronize; after such a failure, the operator may connect one or all machines to the bus manually via the master control switch, manual synchroscope system, and breaker control switches. Each generator control section shall have separate alarm relays/lights to shut down and disconnect a failed generator and display the failure on the OIP; in automatic ("AUTO") mode a failure shuts down and locks out the affected engine until the engine selector switch is cycled through "stop" after correction, then returned to "AUTO."

H. Engine Generator Selector Switch: rotary multistage snap-action type, 600 V AC-DC silver-plated contacts, engraved escutcheon (Basis of Design: Electroswitch series 24, 30A at 600 VAC), four-position "Stop-Off-Auto-Run" switch on each generator control cubicle door, with the functions described for each position (Stop locks out controls and immediately trips the breaker/shuts down; Off allows normal shutdown after a cool-down delay while tripping the breaker; Auto places the unit on standby to start on an ATS start signal; Run starts and holds the unit running for test/manual operation until returned to Off or Stop).

I. Sync Selector and Frequency Meter Switches: each synchronizing breaker has a keyed sync switch and a separate keyed frequency meter switch to operate the master cubicle synchroscope and frequency meter, with removable keyed handles (removable only in the Off position) ensuring only one breaker can be synchronized at a time.

J. Manual Sync Enable Pushbutton: each generator control cubicle has a pushbutton allowing an operator to bring the generator into synchronism with the bus during manual paralleling.

K. Sync Check Relay: a separate sync check relay in the master control cubicle, used for manual sync operation only (5A rated output contacts); systems using the automatic synchronizer in a sync-check or automatic mode for manual operation are unacceptable.

L. Master "Manual-Auto" Control Switch: a spring-return-to-center, three-position selector switch on the master control cubicle door; placing it in "Manual" annunciates the condition and places the generator breakers and synchronizing under manual operation via a swing panel in the master control section (synchroscope, synchronizing lights, frequency meter, bus voltmeter) coordinated with the breaker control switches and synchroscope/frequency meter switches on each generator control section door.

M. Master Operator Interface Panel (OIP): an industrial computer with a 19-inch diagonal TFT color touch screen, 1920 x 1080 (16:9) HD resolution, 5 ms response rate, communicating with both system PLCs and updating PLC time every second for event coordination, with preprogrammed high/low set-point limits and a maintenance (cleaning) mode; screens are described in Article 2.14.

N. Meters: switchboard instruments, 4.5-inch square recessed case, 250-degree scale, white dial/black figures, 60 Hz, 1% accuracy, for ammeters (5 A scale for primary

current), frequency meter (55-65 Hz), wattmeters (calibrated, scale for available kW), and voltmeters (150 V, 3-wire movement, scale for primary voltage).

O. Meter Selector Switches: rotary multistage snap-action type, 600 V AC-DC silver-plated contacts (Electroswitch series 24, 30A at 600 VAC), for ammeter (Off, 1, 2, 3), sync (Off/On), frequency meter (Line, Off, Load), and voltmeter (Off, 1-2, 2-3, 3-1 / 1-N, 2-N, 3-N) functions.

P. Potential Transformers: 120 V single secondary, primary fusing, secondary circuit breaker protection, primary/secondary ratio as required, burden and accuracy consistent with connected devices, 60 Hz.

Q. Protective Relaying: utility-grade, drawout case or provided with CT and PT test switches to isolate relays from PTs/CTs for testing; protective relays shall be separate and independent from all other controllers, including the PLC control system and engine-mounted controls, coordinated with the generator breakers, bus, and distribution breakers per IEEE C37.2 and NFPA 110.

R. Synchroscope: switchboard instrument, 4.5-inch square recessed case, 360-degree scale, white dial/black figures, 60 Hz, 1% accuracy, 150 V movement, Slow-Fast scale.

S. Programmable Controllers: a pair of Siemens High-Availability Hot-Standby Redundant automation controllers (SIMATIC S7-1500H, CPU S7-1517H) with PROFINET I/O and Media Redundancy Protocol (MRP) ring topology; the primary and backup CPU run the same program/data, continuously synchronized via redundant full-duplex fiber-optic cables for seamless switchover on primary failure; program, data blocks, technology objects, and hardware configuration are stored on non-volatile flash memory. If both CPUs become inoperable, the system shall default to manual control with audible/visual alarms; a standby-mode start signal or an already-operating condition shall be handled per Article 2.3, with full manual control available via hardwired interlocks.

T. Over/Under Voltage and Frequency Relay: an overvoltage (100-125%), undervoltage (75-100%), overfrequency (50-70 Hz), and underfrequency (50-70 Hz) relay shall monitor bus voltage/frequency, alarm, and initiate load shedding as required, energizing red failure lights, auxiliary contacts, and a master control section alarm; each set point has an independent adjustable time delay (1-30 seconds). A bus under-frequency condition starts all available engines and immediately trips all non-Priority-#1 loads (load shedding); load is automatically restored once the bus returns to normal frequency and the alarm is reset via the failure reset pushbutton.

U. All control cubicles shall have interior convenience LED lighting with a motion detector (light on when the door is opened) and a convenience receptacle, both powered by an external, remote 120 VAC, 20 A control power source provided by the Electrical Contractor.

2.14 MASTER OPERATOR INTERFACE PANEL SCREENS

A. Menu Screen: indexes all OIP screens.

B. Security Screen: password required to change any control set point (up to eight password levels); no password required to view settings/status; password entry/change via a virtual keyboard, with an adjustable password timer that reactivates the lock after inactivity.

C. Date and Time Screen: allows the operator to change the system date and time.

D. Legend Screen: describes the meaning of each symbol/color on the one-line screen (Red = closed/energized, Green = open/de-energized, Flashing = trouble, Grey = future).

E. System Single Line Screen: main access screen, with a "Menu" soft-key; displays an interactive single line of the paralleling switchgear, an overview status block (auto/manual mode, load demand system on/off, load control auto/manual, load-test/no-load-test status), generator status and actual/rated kW and breaker open/closed status for each generator, feeder breaker open/closed status, with device symbols and bussing shown red when energized and green when de-energized. Touching a device symbol (engine, breaker, ATS, load bank) opens a pop-up screen with available information.

F. PLC Communication Status Screen: indicates OIP communication with both system PLCs, run/disabled state, and PLC scan time for each.

G. Engine Data Screens: a pop-up metering screen per generator with twelve individual dial-type analog meters (oil pressure, oil temperature, coolant temperature, left/right exhaust temperature, engine RPM, engine battery voltage, generator voltage, frequency, power factor, current, and kW), soft keys for phase-to-phase voltage (A-B, B-C, C-A) and individual phase current, and soft keys to switch the kW meter among kW, kVAR, and kVA; metered values also shown in digital readout form together with all available engine/generator communications data. Engine operating hours and total starts shall be displayed, with a bar-graph generator loading indication, a visual replication of the engine control switch position, and cool-down/fail-to-synchronize timer set points and real-time status.

H. Automatic Transfer Switch Data Screens: each transfer switch shall be represented by a pop-up metering screen with individual dial-type analog meters displaying voltage, frequency, power factor, current, and kW, with soft keys for phase-to-phase voltage (A-B, B-C, C-A) and individual phase current, and soft keys to switch the kW meter among kW, kVAR, and kVA; metered values also shown in digital readout form together with all ATS data available through the communications link to the transfer switch. The screen shall include a visual replication of the transfer switch showing its actual position, with timer set points and real-time timer status for cool-down and fail-to-synchronize functions displayed; an operator shall be able to control the

transfer switch from the screen. Each of the distribution ATS units described in Article 1.9 shall have the capability to provide and communicate this data to the system.

I. Demand Mode Screens: allow selection of one of three generator loading control modes -

   1. KW Based Spinning Reserve - operator selects the excess kW capacity to maintain; the system automatically adds/removes engines to maintain the selected reserve.
   2. Engine Generator Spinning Reserve - operator selects the number of engines to run for reserve capacity (e.g., N+1 or N+2); load is balanced/shared among on-line units, defaulting to keeping larger units on-line if the units are dissimilar.
   3. Percent KW Based Generator Demand - operator selects increase/decrease load set points (e.g., 90%) at which the next unit starts or a unit is taken off-line while maintaining capacity at the decrease set point. All three modes shall never remove a generator where doing so would overload the system; each mode has a set-point/status screen showing real-time add/remove values, engine sequence, on-line/off-line status, and totalized running hours.

J. Load Control Screen: displays load priority and expected kW for each load control device (ATS, breaker, or contactor) and start/load-shed/block-transfer signal status; operator can select priority and set anticipated load level per device, with sub-priority selection (e.g., 1.10 adds a load 10 seconds after priority 1 is called, 1.20 after 20 seconds), and displays device position status and manual add/shed status.

K. Master Control Screen: two virtual switches - automatic/manual mode selection, and generator no-load/load testing with selected load control devices - plus a bus alarm reset pushbutton and a running time counter (days, hours, minutes, seconds) for the latest system operation.

L. Load Bank Engine Controls Screen: a test screen to select which engines are tested, whether started all at once or sequentially (consecutive or concurrent), with a virtual selector switch per engine for test mode and a digital test-duration display per unit.

M. Manual Breaker Controls Screen: displays feeder breaker positions and allows Open/Close pushbutton control from the OIP (disabled in Automatic mode).

N. Active Alarm Screen: displays up to 2,048 active alarms with activation time; a red OIP alarm indicator illuminates on the master cubicle door; operator may acknowledge individual or all alarms and filter by priority/group.

O. Alarm and Event History Log Screen: displays up to 2,048 alarms/events, filterable by priority/group, with the ability to launch an external program to search daily-stored historical files by keyword or filter. Any switch operation, from the OIP or a hard-wired switch, shall be logged with time of operation and operator login.

P. Help Screens: accessible from each set-point/control screen, providing a brief explanation of the associated set points/controls.

Q. Generator System Run Reports: an OIP pushbutton initiates logging for generator and transfer sequence parameters required for system testing, producing three report types - Engine Generator Testing Data (per unit), Transfer Test and Timing Data, and the Alarm and Event Log.

1. Engine Generator Testing Data shall include date/time stamps of each gen-set run period and kW set-point requirement; graphical trend and maximum/average values of generator kW, kVA, and kVAR; graphical trend and maximum/average values of A, B, and C phase amperes; graphical trend and maximum/average values of AB, BC, and AC phase voltage; graphical trend and maximum/average values of generator volts, amps, RPM, and frequency; graphical trend and maximum/average values of engine coolant temperature, oil pressure, and battery voltage; and graphical trend and maximum/average values of engine left/right exhaust temperature.
2. Transfer Test Data shall include time/date stamps for each engine start signal (on/off) and normal/emergency position (open/closed).
3. Alarm and Event Log shall capture all alarms and events during the recording period, encompassing generator set, ATS, circuit breaker, and switchgear operational activity monitored by the switchgear PLC system.

R. Joint Commission Reports: a separate OIP pushbutton initiates logging of all information required to generate a report of generator and transfer switch parameters for a The Joint Commission (TJC) report, producing three report types - Engine Generator Testing Data (per unit), ATS Test Data, and the Alarm and Event Log.

2.15 INSTRUMENT AND CONTROL WIRING

A. Instrument and control wiring within the switchgear sections shall be flame-retardant, type SIS, extra-flexible, tinned copper, rated 600 V, approved for switchgear use.

B. Control wiring shall be protected with individual circuit breakers with trip indication, monitored by the system PLC and alarmed on the OIP and logged in the event log.

C. All wire terminations at meters, relays, and similar devices shall use ring-tongue or locking-spade crimp lugs, or as required by the device termination point.

D. All terminations shall be clearly identified with heat-embossed vinyl sleeve markers at each end (labeling tape or paper wire markers are not acceptable); wire numbers shall match the manufacturer's interconnection, schematic, and wiring drawings.

E. Terminal blocks shall use Cage-Clamp technology, clearly marked for wiring to be installed/reconnected by the Contractor; connections between shipping sections shall use plug connections to reduce installation time.

F. Cage-Clamp terminal blocks providing high clamping force, maintenance-free terminations, shall be provided for secondary wire terminations.

G. All current transformers shall be connected to shorting-type mechanical lever-arm switches with test points; CT secondary wiring shall be #12 AWG.

H. Control wiring shall be labeled at each terminal point, with designations keyed to wiring diagrams.

2.16 SWITCHGEAR CONSTRUCTION

A. Switchgear Framework: freestanding, floor-mounted, indoor type, NEMA 1; dead front, dead rear; fabricated on a die-formed steel base assembly, welded or bolted, to rigidly support the shipping unit for rolling and floor mounting; die-pierced holes for aligning adjacent sections and facilitating future additions; zinc-plated Grade 5 bolts, nuts, and Belleville spring washers; designed to withstand shipping/handling stresses in addition to operational electrical/mechanical stresses; code-gauge steel framework (12 gauge minimum) suitable for floor anchorage; rugged, rectangular-rigid steel assemblies with bracing, reinforcing gussets, and jig-welding, completely metal-enclosed; open bottom as required for conduit termination, with top/bottom conduit and bus duct areas clearly shown and dimensioned on shop drawings; removable side/top/front/back panels, bolt-attached and sized for one-person handling; hinged front and rear doors with lock-type operating handles on all cubicles; individual front doors for each power circuit breaker compartment (layout reviewed at shop drawing submittal); adequate top/bottom ventilation openings for the switchboard assembly.

B. Dimensions: conform to the arrangement/details shown on the drawings and the designated installation space; highest operating handles shall not exceed 6 ft 6 in above the switchgear sill; adequate gutter space on all sides for accessibility of feeder conductors and bus ducts.

C. Painting: all steel parts prepared by a five-step cleaning, phosphatizing, and sealing process, then finished ANSI 61 gray polyester powder coat, electrostatically applied and oven-cured, suitable for indoor and outdoor application, with corrosion resistance per ASTM B117 for 1,000 hours minimum.

D. Bus Bars and Interconnections: all buses and stub connections shall be silver-plated copper, plated after bending/machining; 480 V, 3-phase, 4-wire, 60 Hz unless otherwise specified; bus sized so current density does not exceed the current-carrying capacity of the rectangular copper bars per UL/NEMA standards, with heat-rise tests per UL 1558; buses/interconnections limited to 30°C temperature rise at load current capacity at 40°C ambient; bus bar and interconnection joints silver-plated, constant-high-pressure type, with Grade 5 zinc-plated bolts/nuts/Belleville washers; bus bracing capacity equal to or greater than the frame rating of the main breakers served; ground bus with 25% current-carrying capacity of the switchgear bus, extending the full assembly width; bus phase designation A, B, C front-to-back/top-to-bottom/left-to-right viewed from the front; main horizontal bus bars between sections located to permit maximum conduit/wiring area; main power bus

continuous ampere rating as shown on the contract drawings/Article 2.11, with bus connections to the power circuit breakers matching breaker frame size.

E. The switchgear shall consist of metal-enclosed cubicles and auxiliary compartments: power circuit breakers in individual front compartments with separate doors; buses in rear compartments with inter-cubicle and/or rear cable compartment isolation barriers; all compartments completely enclosed within grounded metal barriers isolating secondary control devices/wiring from all 480 V primary devices; interlocks for proper sequencing and safe operation; where a rear compartment houses control components, grounded metal personnel-protection barriers shall isolate the bus compartments.

F. Nameplates: externally visible, permanent nameplates on the switchgear and control cubicle doors identifying each instrument, instrument switch, meter, protective relay, control switch, indicating light, and circuit breaker compartment (relays designated by use and connected phase); nameplates shall be laminated plastic, bolt-attached, white-engraved characters on black background; internal equipment (relays, timers, PLC equipment) and terminal blocks shall be identified with thermally embossed labeling tape.

G. Miscellaneous: system controls shall use heavy-duty industrial-grade controls and relays; all synchronizing and failure circuit relays shall embody the fail-safe principle of dual contacts in parallel; the switchgear manufacturer shall provide coordinating wiring diagrams showing electrical connections between the control switchgear and the engine generators for use by the Electrical Contractor and generator service personnel during installation/checkout; provide an overhead circuit breaker hoist system traversing the length of the power switchgear via a front-and-rear rail system, manually operated by hand crank, minimum rated capacity 1,200 lbs.

2.17 EQUIPMENT DESCRIPTION - MASTER CONTROL CUBICLE

The master control cubicle shall control both automatic and manual synchronization of the engine generators, load management, and engine sequencing, and shall include: a synchronizing swing panel on the cubicle door with one bus AC voltmeter, one synchroscope, two synchronizing lamps, and one frequency meter (55-65 Hz, station bus and generator units); one automatic (best-battery) DC control voltage sensor system; one voltmeter selector switch (phase-to-phase and phase-to-neutral); two Siemens SIMATIC CPU S7-1517H High-Availability Hot-Standby Redundant PLCs with PROFINET communications, high-speed synchronization, supervised Ethernet, non-volatile flash memory, and integrated power supply; a 19-inch HD 1080p (1920 x 1080) touch-screen OIP per Article 2.14; a main bus over/under voltage-frequency alarm relay (Crompton type 27/59 or equal) with alarm indication; a bus alarm reset pushbutton; a sync-check relay for manual sync control; a master "Auto-Man" switch with red light; a lamp-test pushbutton; a back-lit annunciation panel per the schedule in Article 2.17.A below; a USB port on the cubicle door, connected to the OIP, for downloading event/alarm logs (e.g., Joint

Commission test reports); Ethernet ports (one on the door, one internal spare) wired to an Ethernet hub connecting the system PLCs and other Ethernet-capable devices via MODBUS TCP/IP for troubleshooting and customer access; one set of three-phase, 10,000 A main bus, neutral bus, and separate ground bus, all silver-plated copper; a 120 VAC convenience duplex receptacle wired for externally supplied control power; and control wiring, DC circuit breakers, Wago terminals, and nameplates as required, with all wiring labeled at both ends.

A. Master Cubicle Annunciation Panel Schedule: Alarm horn silenced (Amber, Status); Control not in automatic (Red, Status); Critical control voltage failure (Red, Alarm); Load shed on (Red, Alarm); PLC No. 1 in control (Green, Status); PLC No. 2 in control (Green, Status); Operator Interface Alarm (Red, Alarm); PLC failure, flashes on low battery (Red, Alarm); Arc reduction mode active (Red, Alarm); Start signal present (White, Status); four (4) spare points.

2.18 EQUIPMENT DESCRIPTION - GENERATOR CONTROL CUBICLES

A separate generator control cubicle shall be furnished for each of the three generators, arranged to control the start/stop sequence, synchronizing, monitoring, and metering of its associated engine generator, including: one AC voltmeter (phase-to-phase and phase-to-neutral); one AC ammeter; one wattmeter; one synchroscope switch with one removable keyed handle for manual synchronizing of one breaker at a time (key-interlocked); one manual sync enable pushbutton; one frequency meter switch with bus-off-generator nameplate (key-interlocked); one voltmeter selector switch; one ammeter selector switch; one circuit breaker control switch with a separate back-lit LED annunciator for breaker status (open, closed, withdrawn) matching the other annunciators; one PLC distributed I/O module (I/O modules, communication modules, power supplies, etc.) for starting/stopping controls; one automatic synchronizer (Woodward type SPM-D2-10 or equal) for individual phase-lock control; one reverse power relay (Basler drawout type BE1-32 or equal); one manual speed adjust with integral locking; an engine selector switch with "Stop/Reset-Off-Auto-Run" nameplate per Article 2.13.H; mounting and wiring of the governor load-sharing module furnished by the engine generator manufacturer; one Modbus/Ethernet gateway interface to the engine generator for alarm/status reading; a lamp-test switch; a back-lit annunciation panel per the schedule below; one 3,200 A frame, electrically operated, drawout power circuit breaker with adjustable overcurrent/short-circuit trip, rated 100 kAIC at 480 VAC; one set of three-phase, 10,000 A main bus, neutral bus, and separate ground bus (silver-plated copper); an illuminated, padlockable-cover arc-reduction selector switch; one set of three metering-class current transformers and one set of three potential transformers (ratios as required); control wiring, DC circuit breakers, fuses, fuse blocks, Wago terminals, and nameplates, labeled at both ends with permanent tubular sleeve wire markers; and one set of ILSCO mechanical bolted-pressure (set-screw) lugs for generator power cable connections.

A. Generator Cubicle Annunciation Panel Schedule: Engine alarm, summary alarm indication of fault type displayed on the OIP (Amber, Pre-alarm); Protective relay tripped (Red, Shutdown); Breaker failure (Red, Shutdown); Engine not available (Red, Flashing, Status); Engine running (Green, Status); Control voltage failure (Red, Shutdown); PLC I/O drop failure (Red, Shutdown).

2.19 EQUIPMENT DESCRIPTION - DISTRIBUTION BREAKER CUBICLES

Provide the required number of individual, metal-enclosed distribution feeder breaker cubicles to accommodate the eleven (11) distribution breakers specified in Article 1.9 (one Life Safety, one Critical, two Equipment System, six Optional Standby, and one load bank breaker); each cubicle shall house no more than three breakers per section, and each shall include: breakers per Article 2.5 sized as required (electrically operated, drawout, UL 1066, adjustable overcurrent and short-circuit trip, rated 100 kAIC at 480 VAC); an illuminated, padlockable-cover arc-reduction mode selector switch (blue, Off-On); one set of three-phase, 10,000 A main bus with fully rated neutral bus and separate ground bus (silver-plated copper); control wiring, DC circuit breakers, fuses, fuse blocks, Wago terminals, and nameplates, labeled at both ends; and ILSCO mechanical bolted-pressure (set-screw) lugs for all circuit breaker connections.

2.20 SCADA DESKTOP WORKSTATION

A. Provide and commission a SCADA workstation computer and software, installed in the paralleling switchgear room. All information available at the switchgear's OIP shall be available at the workstation, including all data screens, single-line diagrams, password protection, and controls; furnish hardware description, accessories description, warranty, and support documentation for the workstation PC.

B. Provide and commission a SCADA system for the generator control switchgear and ancillary equipment, including a Master Display Station (MDS) consisting of a desktop computer with remote web access via Ethernet. The SCADA system shall be menu-driven; have graphic multicolored displays; permit remote operation and control set-point adjustments; have security log-on protection; be multi-tasking, enabling system monitoring as a background task while performing a database or spreadsheet function as a foreground task; and display real-time data from each generator control cubicle (pre-alarm, alarm, engine status, engine selector switch status, generator breaker position, generator volts/amps/kW/frequency) and from the master control cubicle PLC (system annunciation, generator bus voltage/kW/frequency, load demand set-point and timer settings, manual/auto selector switch position, and all remaining master control settings). Limited control from the MDS shall include system test and load demand enable/disable and set-point adjustments.

C. Provide Win911 (or equal) alarm and paging integration to the system via an Ethernet connection provided by the Owner, including a NAT router.

D. The Master Display System shall consist of a Dell computer (or equal), furnished with a 24-inch monitor with three-year warranty, ergonomic mouse pad with wrist support, and a USB flash drive, and shall display the following on a minimum of four separate screens:

1. System One-Line: single-line diagram of the generator control switchgear and Automatic Transfer Switches, with power flow shown by color change (open breaker/de-energized bus green, closed breaker/energized bus red, locked-out breaker yellow), including a menu for the operator to access SCADA control and monitoring features.
2. Security/Log: restricts SCADA system access to authorized personnel, with over 1,000 levels of password capability.
3. Alarm and Events: a log of all status points, including shutdown and pre-alarm alarms, breaker operations (trip/close), set-point and timer adjustments, test operations, and power failures.
4. Setpoints: allows the operator to view or change the set points associated with load demand.

PART 3 - EXECUTION

3.01 COORDINATION

A. The Switchgear Manufacturer shall provide coordinating interconnect diagrams showing the electrical connections between all equipment specified in this Section, for use by the Electrical Contractor and switchgear service personnel during installation and checkout.

B. The Engine Generator Vendor (Section 16900) will supply the Switchgear Manufacturer with required engine interface hardware, electronic governor, and voltage regulator components, along with detailed interconnection and mounting drawings; the Switchgear Manufacturer shall mount and wire this equipment.

C. The Switchgear Manufacturer shall verify completion of all start-up commissioning and site testing of the paralleling switchgear system, and shall assist the Engine Generator Vendor as necessary with generator site start-up and testing.

D. The Electrical Contractor shall obtain and provide the selective coordination and arc-flash study and furnish the approved study, with required protective relay settings, to the switchgear manufacturer's start-up field engineer prior to commencement of switchgear startup procedures.

3.02 FACTORY TESTING

A. At the factory, the Switchgear Manufacturer shall test the switchgear and generator controls as required to verify proper operation of each component and demonstrate

full compliance with this Specification; factory test reports shall be available upon request.

B. Equipment shall be completely assembled, wired, adjusted, and tested at the factory; rigid inspections before and after assembly shall assure correctness of design and workmanship, and each switchgear assembly shall be tested for operation under simulated conditions.

C. After visual inspection, perform the following operational tests: operate all circuit breakers in connected and test positions and check all interlocks by attempting to close breakers into interlocked configurations; check racking mechanisms by removing/reinstalling each breaker; check the stored-energy mechanism of each breaker by tripping/closing/tripping after removal of control power; perform dielectric tests; and test all protective relay devices by simulation.

D. The Manufacturer shall supply all equipment, devices, and circuitry required to simulate all synchronizing and paralleling functions, digital and analog signal inputs/outputs and confirmation signals, and diesel generator control and operation, including automatic and manual operation of the paralleling circuit breakers and protective/indicating devices.

3.03 PACKING AND SHIPPING

A. The Switchgear Manufacturer shall prepare all equipment to protect it against damage in transit, adequately packed against handling, weather, shock, vibration, and corrosion during shipment.

B. All metering and equipment shall be protected for cleanliness during shipment, storage, and erection; each item shall be clearly marked, with boxes/crates/shipments numbered and identified with the Owner's purchase order number, Owner's name and delivery location, manufacturer's name and address, and contents; all equipment shall have clearly marked lifting/skidding provisions; each shipping unit shall be adequately and rigidly braced internally and externally; assemblies requiring disassembly for installation, or shipped disassembled, shall be uniquely identified as to assembly position, with all loose peripheral equipment boxed/crated/enclosed during storage, handling, and shipment.

C. All equipment and material shall be shipped to the job site unless otherwise instructed, adequately protected, braced, and secured to prevent physical and environmental damage during transit and handling; material not mounted on the major equipment during shipping shall be properly crated and shipped with the associated equipment.

D. Drawout circuit breakers shall be crated and shipped separately if recommended by the breaker vendor; otherwise breakers shall be shipped within the system.

E. The Vendor shall coordinate shipping of all equipment and material with the Contractor; shipping sections shall be arranged to permit transport through limited

access as required; equipment shall be equipped for handling by crane, pallet jack, and rollers.

3.04 EXAMINATION

Verify the paralleling switchgear room is complete (two-hour fire-rated construction, ventilated, concrete housekeeping pad in place per Article 1.4) and physically separate from the Generator Room (Section 16900) before setting equipment.

3.05 INSTALLATION

A. The Electrical Contractor shall provide labor for installation of the paralleling switchgear system plus all associated external power and control wiring, and shall be responsible for all rigging required for unloading and installation.

B. Set and align the switchgear on its concrete housekeeping pad per the Switchgear Manufacturer's installation procedures; the Manufacturer shall assist the Electrical Contractor as required in interpreting installation instructions, and the Electrical Contractor shall certify to the Manufacturer and Owner that installation has been performed per the latest documents and instructions.

C. Connect generator feeders and distribution feeders per the approved shop drawings; program synchronizing, load-sharing, and load-shed/load-add controls per the coordinated sequence of operation with Section 16900.

D. The Electrical Contractor shall be responsible for providing and installing a 1,750 kW load bank for start-up testing and adjustment of the system, sized to match the output of one generator, for use with the dedicated load bank breaker specified in Articles 1.9 and 2.10.

E. The Design-Build Contractor shall be responsible for the installation and connection of all interconnections of control and communication wiring between equipment supplied for the facility, including: the paralleling switchgear; the generators and auxiliary equipment (day tanks, battery chargers, remote annunciators, etc.) of Section 16900; the Double-Ended Substation of Section 16600; the SCADA computer specified in Article 2.20; the Building Management System; and the Automatic Transfer Switches of Section 16700.

F. Following installation, the Switchgear Manufacturer shall inspect and verify the correct installation of the switchgear, including all individual components.

3.06 FIELD QUALITY CONTROL

A. Perform functional testing of the synchronizing and paralleling scheme with all three generators, verifying correct phase sequence, voltage, and frequency matching before closing generator breakers onto the common bus.

B. Perform load-bank testing per NFPA 110 to verify load-shed/load-add logic and generator capacity under simulated single- and two-generator-out conditions, using the dedicated load bank breaker specified in Article 1.9/2.10.

C. Field-set and verify all protective relay settings per the selective coordination and arc-flash study specified in Article 3.1.D.

D. The Electrical Contractor shall be responsible for installation and testing of the settings on all switchgear circuit breakers based on the selective coordination study.

3.07 FIELD SERVICE START-UP AND TRAINING

A. The Switchgear Manufacturer shall provide a field service engineer for a pre-installation coordination meeting with the Engine Generator Vendor and Electrical Contractor to coordinate installation and interconnection of the switchgear and generators.

B. The Switchgear Manufacturer shall provide a field engineer for an initial visit to check out the switchgear installation and allow energization of the utility main service breaker if required, and shall provide a field engineer for post-installation start-up and testing assistance prior to system turnover, including initial instruction and training of the facility's operating personnel and demonstration of complete system operation for final acceptance.

C. At system start-up, the Manufacturer shall furnish two preliminary sets of installation, operating, and maintenance manuals; at the conclusion of site testing, the field engineer shall leave one manual at the site, amended with any changes occurring during start-up, to serve as a reference until final O&M manual sets are supplied. Instructions shall include recommended field test procedures per the referenced Standards and a schedule of prescribed field test frequency.

D. Approximately six months after complete system turnover, a follow-up visit shall be made to provide operating personnel instruction on the complete operation and maintenance program for the switchgear system.

E. The bid shall include the cost of a factory-authorized service representative to train the Owner's on-site work force on programming, relay setting, startup, shutdown, troubleshooting, servicing, and preventive maintenance of all equipment. Instruction shall be dedicated and intensive, provided by competent instructors fully familiar with the equipment, presented in an eight-hour session for which the Owner will provide a suitable classroom environment; the Owner may elect to record the sessions; training shall be scheduled with at least seven working days' advance notice; and both classroom and hands-on training shall cover: safety precautions; features and construction of the switchgear and accessories; routine inspection, test, and maintenance procedures; routine cleaning; features, operation, and maintenance of protective devices; interpretation of readings of indicating and alarm devices; review of the O&M manuals; and review of troubleshooting operations.

END OF SECTION 16800

SECTION 16900 DIESEL ENGINE-DRIVEN GENERATORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: The furnishing, delivery, installation, testing, and commissioning of three (3) diesel engine-driven generator sets, associated day fuel tanks, and bulk diesel storage for the emergency standby power plant serving the Puerto Rico Trauma Hospital, Basement Generator Room, San Juan, Puerto Rico.

B. Coverage: The emergency generator plant constitutes the sole source of emergency and standby power for 100% of the building electrical load, including all NFPA 99 Essential Electrical System (EES) branches (Life Safety, Critical, and Equipment System) and the Optional Standby System per NEC Article 702. There are no normal-power-only (unbacked) building loads.

C. The system shall be classified and designed as:

1. NFPA 99 Category 1 - healthcare occupancy essential electrical system source.
2. NFPA 110 Type 10, Class 48 (or greater), Level 1 - emergency and standby power system.
3. NEC Article 700 - Emergency Systems (Life Safety Branch).
4. NEC Article 701 - Legally Required Standby Systems (Critical Branch, Equipment System).
5. NEC Article 702 - Optional Standby Systems (Optional Standby / Non-Essential loads).

D. Redundancy: Three (3) generator sets are installed in an N+1 configuration. Any two (2) generators operating in parallel shall carry 100% of the connected building load. The third generator is the standby spare. Run-hour equalization shall rotate the lead, lag, and spare designations among all three units on a scheduled basis.

1.02 RELATED SECTIONS

A. Related Sections include:

1. Section 16100 - Basic Electrical Materials and Methods.
2. Section 16700 - Automatic Transfer Switches.
3. Section 16800 - Paralleling Switchgear.

1.03 APPLICABLE CODES AND STANDARDS

A. Design, equipment, installation, and testing shall conform to the following codes and standards, latest editions adopted in Puerto Rico unless a specific edition is cited. The most stringent requirement governs.

B. Life Safety and Electrical Codes:

1. NFPA 99 - Health Care Facilities Code: Category 1 occupancy; Essential Electrical System (EES) requirements; generator performance, testing, and maintenance.
2. NFPA 110 - Standard for Emergency and Standby Power Systems: Level 1, Type 10, Class 48 (minimum); generator sets, ATS, fuel systems, battery systems, testing.
3. NFPA 70 (NEC) - National Electrical Code: Articles 445 (Generators), 700 (Emergency Systems), 701 (Legally Required Standby), 702 (Optional Standby), 517 (Health Care Facilities).
4. NFPA 37 - Standard for the Installation of Stationary Combustion Engines and Gas Turbines.
5. NFPA 30 - Flammable and Combustible Liquids Code: fuel oil storage and handling.
6. NFPA 101 - Life Safety Code: generator room fire rating, means of egress.
7. NFPA 72 - National Fire Alarm and Signaling Code (fire alarm in generator room).
8. NFPA 20 - Standard for the Installation of Stationary Pumps for Fire Protection (fire pump power coordination).

C. Engine and Generator Standards:

1. NEMA MG-1 - Motors and Generators: generator winding insulation, temperature rise, and electrical performance.
2. ISO 8528 - Reciprocating Internal Combustion Engine Driven Alternating Current Generating Sets (all applicable parts).
3. SAE J1349 - Engine Power Test Code: engine power rating.

D. Fuel System Standards:

1. NFPA 30 - Flammable and Combustible Liquids Code.
2. NFPA 37 - Stationary Combustion Engines: fuel piping, venting, and containment.
3. NFPA 110 - Emergency and Standby Power Systems: fuel system capacity, day tank requirements.
4. EPA 40 CFR Part 60 Subpart IIII - Standards of Performance for New Stationary Compression Ignition Internal Combustion Engines: Tier 2 emissions compliance.
5. UL 142 - Steel Aboveground Tanks for Flammable and Combustible Liquids (day tanks).

E. Puerto Rico and Utility Requirements:

1. Puerto Rico Building Code (PRBC), incorporating 2018 IBC with Puerto Rico amendments: structural loads, seismic, wind (Category 5, 180 mph design wind speed).
2. Puerto Rico Department of Health (PRDOH) - Hospital Licensure Regulations, Regulation 9184.
3. Puerto Rico Environmental Quality Board (PREQB / JCA) - air permit, emissions, and fuel storage permit requirements.
4. FAA Advisory Circular AC 150/5390-2 - Heliport Design: exhaust discharge location shall not compromise the heliport approach/landing zone or heliport FAA lighting.

1.04 SUBMITTALS

A. Submit the following at the Design Development phase for Engineer review and approval before purchase or fabrication:

1. Generator set data sheets: engine ratings (kW, fuel consumption at 25%/50%/75%/100% load), alternator ratings, winding class, insulation, short-circuit capability, voltage regulation, transient response, cooling type, dimensions, weight, fuel consumption curves.
2. Complete generator set outline drawing with dimensions, accessory locations, combustion air and radiator discharge areas, exhaust connection location, baseframe anchor bolt pattern.
3. Engine specifications: manufacturer, model, displacement, rated RPM, turbocharged confirmation, EPA Tier 2 certification documentation.
4. Alternator specifications: manufacturer, model, kVA/kW rating, power factor, voltage regulation class (G2 or better per ISO 8528-3), insulation class, temperature rise, short-circuit withstand.
5. Generator control panel schematic and description: auto-start sequence, synchronizing logic summary, protective relay list, alarm/shutdown set points.
6. Day tank shop drawings: UL 142 listing, dimensions, capacity, accessories (level gauge, overfill, vent, fill connections, day-tank transfer pump if applicable).
7. Fuel transfer system submittal: pump data, piping material, automatic transfer controls, float-switch level controls, alarm wiring.
8. Exhaust system submittal: exhaust silencer data (sound attenuation), flexible exhaust connector data, exhaust pipe material and insulation.
9. Vibration isolation submittal: isolator model, static deflection, rated load per mount, installation arrangement.
10. Acoustic treatment submittal: materials, STC ratings for room walls/ceiling/louvers, insertion loss of louver acoustic lining.

11. Battery system submittal: battery type, cold-cranking amps (CCA), charger model, battery rack.
12. Air permit application: D&B Contractor shall prepare and submit an air permit application to PREQB/JCA for three (3) emergency diesel generators; submit permit application documentation to Engineer.

B. Factory Test Reports - Submit before delivery is accepted:

1. Certified factory test report for each generator set: full-load run at 100%, 75%, 50%, 25%; voltage and frequency regulation data; transient voltage and frequency response on block-load application and load rejection; fuel consumption data.
2. Engine emission test data confirming EPA Tier 2 compliance.

C. Operation and Maintenance Manuals - Submit 30 days before commissioning:

1. Complete O&M manual: start/stop procedures, weekly/monthly/annual maintenance schedules, troubleshooting guide, parts list, engine tune-up specifications, alternator maintenance.
2. Fuel system O&M manual: day tank fill procedures, pump operation, level alarm setpoints.

1.05 QUALITY ASSURANCE

A. Generator Set Manufacturer: Provide generator sets from a single manufacturer who produces both the engine and alternator as a matched, integrated set, or who provides the complete integrated package with a single point of warranty responsibility. The complete generator set - engine, alternator, controls, baseframe - shall be factory-assembled and tested as a unit before shipment.

B. Factory Testing: Each generator set shall undergo a complete factory load test, minimum 2-hour run at 100% standby rated load. Certified test reports shall be submitted and accepted before delivery.

C. NFPA 110 Compliance: The complete system (generator sets, fuel system, starting batteries, and controls) shall be designed and installed to meet all NFPA 110 Level 1 requirements, including the 10-second start-to-load readiness requirement, fuel supply duration, monthly exercise, and annual load bank test.

D. Air Permit: The D&B Contractor shall obtain all required air quality permits from the Puerto Rico Environmental Quality Board (PREQB/JCA) for operation of three (3) diesel generators. Permit application shall be submitted at Design Development phase.

E. UL Listing: Each generator set shall be listed and labeled by Underwriters Laboratories (UL) under UL 2200 - Stationary Engine Generator Assemblies. The UL 2200 label shall be affixed to each complete generator set as shipped and installed. Submit UL listing documentation with product submittals.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Coordinate delivery with the construction schedule; the Generator Room must be fully enclosed, weathertight, and housekeeping pads complete before generator delivery.

B. Generator sets are large and heavy - confirm access route dimensions (door widths, corridor heights, turning radii) against generator dimensions before delivery.

C. Store generator sets indoors, protected from weather; do not expose alternator windings to condensation; if long storage is anticipated, energize the block heater during storage.

D. Shipping: Generator sets may be shipped on skids without batteries installed; batteries ship separately; install batteries per manufacturer's instructions after installation and before commissioning.

E. Handle only with the manufacturer's designated lifting provisions; do not use exhaust outlets, alternator cooling openings, or the control panel as lift points.

1.07 WARRANTY

A. Generator Set (Engine and Alternator): Manufacturer's standard warranty, minimum two (2) years from initial commissioning or two and a half (2.5) years from ship date, whichever occurs first, against defects in materials and workmanship.

B. The warranty shall include repair or replacement of failed components; warranty service shall be available from a factory-authorized service center located in Puerto Rico or available by next-day travel from the continental United States.

PART 2 - PRODUCTS

2.01 GENERATOR SET RATINGS AND PERFORMANCE

A. Provide three (3) complete diesel engine-driven generator sets, identical and interchangeable, with the following minimum ratings and characteristics:

1. Quantity: Three (3), identical, interchangeable units.
2. Standby Power Rating: 1,750 kW per unit at 0.8 power factor lagging (2,187.5 kVA per unit).
3. Firm N+1 Capacity (any 2 paralleled): 3,500 kW at 0.8 pf, sized to carry 100% of the total connected building load.
4. Total Installed Capacity: 5,250 kW (3 x 1,750 kW).
5. Output Voltage: 480Y/277 V, three-phase (3Ø), four-wire, 60 Hz.
6. Power Factor: Rated at 0.8 pf lagging; alternator capable of operating between 0.8 pf lag and unity pf.

7. Frequency: 60 Hz; steady-state frequency regulation ±0.5% (NEMA MG-1 Class G2 or better).
8. Voltage Regulation: Steady-state ±0.5% from no-load to full load (ISO 8528-3 Class G2 or better).
9. Load Acceptance: Ready to accept full rated load within 10 seconds from start signal per NFPA 110 Level 1.
10. Transient Voltage Response: Voltage dip ≤ 15% on application of rated block load (100% load step); recovery to ±3% within 3 seconds.
11. Transient Frequency Response: Frequency dip ≤ 10% on application of rated block load; recovery to ±2% within 5 seconds.
12. Fuel Type: Ultra-Low-Sulfur Diesel (ULSD, ≤ 15 ppm sulfur).
13. Engine Type: Turbocharged, four-stroke diesel; EPA Tier 2 compliant.
14. Cooling: Unit-mounted, engine-driven radiator and cooling fan; self-contained; no external chilled water cooling.
15. Starting: Electric start, 24 V DC battery; automatic start on loss of utility; two (2) independent starting attempts before alarm.
16. Ambient Temperature: Rated at 40°C (104°F) ambient maximum; designed for Puerto Rico tropical ambient conditions.
17. Seismic Anchorage: Baseframe anchored to the Basement Generator Room housekeeping pad per Puerto Rico Building Code seismic requirements.

B. **REQUIRED:** The D&B Contractor shall confirm by complete building load calculation that 3,500 kW of firm N+1 capacity is adequate for 100% of the facility connected load, including: all ORs, ICUs, Trauma Stabilization, Emergency Department, imaging, heliport, fire alarm, nurse call, Disaster Control Center, elevators, lighting, medical gas compressors and vacuum, BMS/IT infrastructure, mechanical/HVAC equipment (including chillers), and all Optional Standby loads. Calculation shall account for motor starting inrush, VFD harmonic loads, and minimum 10% future surge capacity. If 3,500 kW is found to be insufficient, increase generator kW rating to the next standard size without additional cost to the Owner.

2.02 DIESEL ENGINE

A. Diesel Engine Technical Requirements:

1. Type: Four-stroke, turbocharged (and after-cooled/intercooled) diesel engine; liquid-cooled.
2. Aspiration: Turbocharged and charge-air-cooled (TCAC); no naturally aspirated units.
3. Emissions: EPA 40 CFR Part 60 Subpart IIII, Tier 2 compliant; confirmed by emissions test report; air permit required from PREQB/JCA.

4. Fuel Consumption: Submit at 100%, 75%, 50%, and 25% load; at 100% standby load, typical consumption ≤ 0.36 gal/kWh; confirm by factory test.
5. Speed: 1,800 RPM (direct-coupled or gear-coupled to 4-pole alternator for 60 Hz output); constant speed isochronous governor.
6. Governor: Electronic isochronous governor; steady-state speed regulation ±0.25% from no-load to full load; load-sharing capability for paralleling.
7. Lubrication: Full-flow pressure lubrication; oil temperature within engine limits at rated output and 40°C ambient; provide oil drain valve with extension for oil changes.
8. Cooling System: Liquid-cooled engine block; unit-mounted radiator and cooling fan; maintain engine temperature within design limits at rated load and 40°C ambient.
9. Air Filter: Dry-type air filter with restriction indicator; sized for the generator room intake air quality.
10. Block Heater: Engine coolant block heater (thermostatically controlled, 120 V AC) to maintain coolant at minimum 90°F (32°C) for immediate starting; block heater energized from a dedicated essential branch circuit at all times.
11. Engine Protection: Electronic engine control with automatic protective shutdown for low oil pressure, high coolant temperature, overspeed, overcrank (failure to start), and low coolant level; alarm only (no shutdown) for low fuel level (day tank), low coolant temperature, and battery charger failure.

B. ***NOTE:*** *Block heater circuits shall remain energized from the Essential Electrical System at all times, before, during, and after a generator run, to maintain engine readiness. Block heaters shall NOT be on normal-power-only circuits that would de-energize during utility outages.*

2.03 ALTERNATOR (AC GENERATOR)

A. Alternator Technical Requirements:

1. Type: Brushless, revolving-field, self-excited, single-bearing or two-bearing design; factory-aligned and coupled to engine.
2. Winding: Three-phase, four-wire, reconnectable for 480Y/277 V output; copper magnet wire windings.
3. Insulation Class: Class H insulation; Class F temperature rise (105°C maximum winding temperature rise) for conservative thermal margin.
4. Excitation: Brushless excitation with Permanent Magnet Generator (PMG) pilot exciter preferred; PMG provides stable excitation current independent of generator output waveform distortion from nonlinear loads.

5. Voltage Regulator: Solid-state, electronic automatic voltage regulator (AVR); steady-state voltage regulation ±0.5% no-load to full load; compatible with reactive droop/reactive load-sharing signal for paralleling operation.
6. Harmonic Distortion: Total voltage harmonic distortion (TVHD) ≤ 5% at rated load with linear loads per NEMA MG-1.
7. Short-Circuit Withstand: Alternator capable of supplying minimum 300% of rated current for 10 seconds to allow upstream protective devices to clear faults per ISO 8528.
8. Power Factor Capability: 0.8 pf lag at rated kW to unity pf at rated kW; capable of leading pf operation to absorb capacitive reactive power from VFDs and power correction capacitors.
9. Protection: Internal anti-condensation heater (120 V, thermostatically controlled); winding temperature sensors (RTDs or thermistors) for alarm and protection.
10. Degree of Protection: IP22 minimum (drip-proof) for the alternator inside the Generator Room.

2.04 GENERATOR CONTROL PANEL

A. Each generator set shall be furnished with a factory-mounted, NEMA 1 generator control panel. Automatic Start/Stop Controls:

1. Auto mode: Upon receipt of start signal (utility failure detected), engine starts automatically; accelerates to rated speed and voltage; ready signal transmitted for synchronizing and paralleling.
2. Manual mode: Local manual start/stop for testing and maintenance; local manual emergency stop pushbutton (mushroom-head, red, lockout type).
3. Cool-down timer: Automatic cool-down run at no load (adjustable 0-30 minutes) before engine shutdown after transfer back to utility; timer bypassed by manual stop.
4. Crank disconnect: Automatic disconnect of starting motor upon engine start (overcrank protection: 3 start attempts maximum, then alarm and lockout).

B. Metering and Displays: Each control panel shall provide local indication of:

1. Output voltage (all three phases - VAB, VBC, VCA); output current (all three phases - IA, IB, IC); output frequency (Hz); real power output (kW); power factor.
2. Engine oil pressure (PSI or kPa); engine coolant temperature (°F or °C); engine speed (RPM); battery charging voltage and current.
3. Run hours (cumulative); day tank fuel level (% or inches).

C. Alarm and Shutdown Annunciation (minimum):

1. Alarms (auto restart not interrupted): Low fuel level (day tank); low coolant temperature; battery charger fault; generator on load; high coolant temperature warning; low oil pressure warning.
2. Protective Shutdowns (engine stops, requires manual reset): High coolant temperature shutdown; low oil pressure shutdown; overspeed shutdown; overcrank (failure to start) shutdown; low coolant level shutdown; emergency stop (local or remote).
3. All alarm and shutdown points shall provide dry-contact outputs for remote monitoring.

D. Load-Share and Paralleling Interface:

1. kW load-sharing line: Analog signal output for isochronous load-sharing with the Section 16800 paralleling switchgear.
2. Reactive load-share (kVAR): AVR reactive droop or cross-current compensation for reactive load sharing with other paralleled units.
3. Sync check input: Accept synchronizing pulse from the Section 16800 paralleling switchgear to close the generator output breaker when in synchronism.
4. Run-hour equalization: Control panel shall accept remote lead/lag/spare assignment commands from the Section 16800 paralleling switchgear load-management controller; panel shall display current assignment (LEAD / LAG / SPARE).

2.05 BATTERY STARTING SYSTEM

A. Battery Starting System Technical Requirements:

1. Battery Type: Lead-acid, sealed maintenance-free; 24 V DC system; two (2) batteries per generator wired in series for 24 V.
2. Cold Cranking Amps (CCA): Minimum CCA rating sufficient to crank the engine at 0°C per engine manufacturer's specification.
3. Battery Quantity: Two (2) sets of batteries per generator, a primary set and a secondary/backup set; automatic changeover relay so that if the primary set is depleted, the secondary set engages for a second start attempt.
4. Battery Rack: Non-conductive or insulated battery rack within the generator enclosure or on the engine baseframe; secured for seismic loads.
5. Battery Charger: One (1) automatic two-rate (float/equalize) battery charger per generator, 120 V AC input, 24 V DC output; sized to fully recharge depleted batteries within 4 hours of a 10-second cranking demand.
6. Charger Power: Charger powered from a dedicated Essential Electrical System circuit (Critical Branch or Equipment System) to ensure batteries are

continuously charged during normal operation, utility outages, and generator operation.

7. Testing: Battery load-test (discharge test) shall be performed annually; replace batteries every 3 years or per manufacturer's recommendation, whichever is sooner.

2.06 VIBRATION ISOLATION

A. Provide factory-furnished, spring or rubber anti-vibration isolators between each generator set baseframe and the concrete housekeeping pad:

1. Isolator static deflection: Minimum 1 inch for spring isolators; or rubber isolators with spring rate appropriate for the generator set weight and operating frequency.
2. Isolators shall be rated for the full weight of the generator set plus 25% safety factor.
3. Install isolator quantity and placement per manufacturer's instructions; ensure level installation.
4. Flexible connections: Flexible pipe connectors on all fuel, coolant, and exhaust connections at the generator to absorb vibration; flexible stainless steel bellows connectors on exhaust.
5. Flexible electrical connections: All conduit to the generator control panel shall use flexible metallic conduit or liquid-tight flexible conduit from the last rigid conduit support to the panel; minimum 18-inch flexible section.

2.07 DAY FUEL TANKS

A. Provide one (1) freestanding day fuel tank per generator set, located within the Basement Generator Room. The day tanks provide a local fuel reserve directly serving each engine's fuel system.

B. Day Tank Technical Requirements:

1. Quantity: Three (3), one per generator set.
2. Capacity: Maximum permitted indoor fuel volume per NFPA 30, NFPA 37, NFPA 110, and the Authority Having Jurisdiction (AHJ); D&B Contractor shall confirm the maximum permitted indoor volume with the AHJ and local fire marshal prior to finalizing day tank size.
3. Fuel Type: Ultra-Low-Sulfur Diesel (ULSD, ≤ 15 ppm sulfur).
4. Construction: UL 142 listed, double-wall steel aboveground tank; welded steel construction; all seams continuous-welded and leak-tested at the factory.
5. Containment: Double-wall construction provides secondary containment; interstitial space monitored by leak detection sensor.

6. Spill Basin: Each day tank installed in a concrete spill containment basin capable of holding 110% of the tank's volume; basin waterproofed and liquid-tight; no floor drain inside the basin.
7. Fill Connection: Top-fill connection with anti-siphon valve; camlock fill fitting; dust cap on fill fitting.
8. Vent: Atmospheric vent per NFPA 30; vent routed to the exterior of the generator room per NFPA 37; vent termination with insect screen and weather cap.
9. Supply to Engine: Bottom-mounted fuel supply fitting with shut-off valve; gravity-fed or pump-fed to engine per engine manufacturer's fuel system requirements.
10. Return from Engine: Return fuel line from engine back to day tank; return fitting with check valve.

C. Day Tank Accessories (each tank):

1. Fuel level gauge: Float-type or electronic level gauge with local visual display; alarm outputs for Low Fuel (≤ 25% capacity) and High Fuel (≥ 90% capacity, stop transfer pump).
2. Leak detection sensor: Electronic interstitial leak detector in the double-wall annular space; alarm output to the generator control panel on detection of fuel in the interstitial space.
3. Overfill prevention: Float valve or solenoid valve on the fill line to stop filling at 90% tank capacity; overfill prevention per NFPA 30.
4. Manual isolation valve: Manually operated ball valve on the supply line between the day tank and engine for maintenance isolation; accessible without special tools.
5. Fuel level controls: Float switches or electronic level sensor; low-level alarm at ≤ 25% capacity.
6. Emergency fuel shutoff: Fusible-link or remote-operated emergency fuel shutoff valve on the supply line from the day tank to the engine; per NFPA 37; fusible link shall melt at ≤ 165°F (74°C) to shut off fuel flow in case of fire.

2.08 BULK DIESEL STORAGE AND SUPPLY

A. Provide a building main diesel bulk storage tank supplying the three (3) generator sets, independent of and in addition to the individual day tanks specified in Article 2.7. The bulk storage tank shall provide a minimum 5-day (120-hour) full-load on-site fuel reserve, sized per the D&B Contractor's fuel consumption calculation for the installed generator capacity (3,500 kW normal redundant operating capacity, sized to carry 100% of the connected building load); tank capacity shall be established by that calculation and shall not be limited to a fixed nominal volume. Tank construction, secondary containment, venting, spill containment, and leak detection shall comply with NFPA 30, NFPA 37, NFPA 110, and the AHJ.

B. Resupply Agreement: In addition to the 5-day (120-hour) on-site main tank reserve, the Owner shall separately maintain a contracted diesel resupply agreement guaranteeing delivery sufficient to sustain a minimum 20-day full-load operating capacity, supplementing the on-site bulk storage reserve.

C. Fuel piping, day tank fill pumps, tank venting, spill containment, and leak detection between the bulk storage tank and each day tank shall be provided per NFPA 30 and NFPA 110.

2.09 EXHAUST SYSTEM

A. Each generator set shall have a dedicated exhaust system from the engine exhaust manifold to the exterior of the building, including a critical-grade silencer, flexible exhaust connector, insulated exhaust piping, and weather-resistant rain cap at the exterior discharge point.

B. Exhaust System Technical Requirements:

1. Exhaust silencer: Critical-grade exhaust silencer; insertion loss minimum 25 dB(A); installed upstream of rigid exhaust piping; sized to minimize backpressure at rated engine load per engine manufacturer's maximum allowable backpressure.
2. Flexible exhaust connector: Stainless steel flexible bellows connector between the engine exhaust manifold and silencer inlet; absorbs engine vibration and thermal expansion; rated for exhaust temperature.
3. Exhaust piping: Carbon steel Schedule 40 black iron pipe; sized per engine manufacturer's recommendations (one pipe size larger than engine exhaust outlet); all joints continuously welded; no screwed fittings in exhaust piping.
4. Thermal insulation: Insulate all exhaust piping and silencer within the building with mineral wool or calcium silicate insulation to limit surface temperature ≤ 60°C (140°F) in occupied areas; metal jacket or stainless steel wrap over insulation.
5. Pipe supports: Exhaust pipe supported by spring-isolated pipe hangers to prevent vibration transmission; minimum 2-inch clearance to combustible construction.
6. Exterior discharge: Exhaust discharge at exterior building wall above grade; stainless steel rain cap or elbow turned downward; discharge directed away from building air intakes, occupied areas at grade, the heliport FATO zone and approach path, and the LUMA utility substation.
7. Condensate drain: Low-point condensate drain on each exhaust system with drip leg and manual drain valve; condensate collected in a corrosion-resistant container.
8. Separation: Each of the three generator exhaust systems shall be independent and separated; no common exhaust manifold or combined silencer.

2.10 GENERATOR ROOM VENTILATION AND COMBUSTION AIR

A. The Mechanical Engineer shall design the Generator Room ventilation system to provide adequate combustion air for engine operation at full load and to remove waste heat from the radiators. The Electrical Contractor shall coordinate with the Mechanical Contractor on the following requirements:

1. Combustion air: Each engine requires a clean, unobstructed air supply at the air filter intake. The generator room ventilation system shall provide adequate outdoor air to support three (3) engines at rated load simultaneously, per the combined combustion air volume requirement stated in the engine manufacturer's installation specifications.
2. Radiator air discharge: Each generator set's engine-driven radiator fan discharges heated cooling air into the generator room. The generator room ventilation system shall exhaust this heated air to the exterior to prevent recirculation. Airflow path: fresh air intake louvers, generator room, radiator discharge, exhaust louvers.
3. Room temperature limit: The generator room temperature shall not exceed 40°C (104°F) at the engine air filter intake under any combination of operating generators (up to three) at full load.
4. Intake louver location: Fresh air intake louvers shall be located away from the exhaust discharge points and fuel storage vents to prevent recirculation of hot combustion exhaust into the engine air supply.
5. Louver acoustic treatment: See acoustic treatment requirements in Article 2.11.

B. ***CAUTION:*** *Exhaust discharge and intake louver locations shall be coordinated with the Architect and MEP team to prevent exhaust re-entrainment. Exhaust backpressure shall be checked against the engine manufacturer's maximum allowable backpressure at full load with all exhaust components installed.*

2.11 ACOUSTIC DESIGN REQUIREMENTS

A. The Generator Room shall be acoustically treated to limit sound transmission to adjacent occupied spaces and to the building exterior, per the project acoustic design criteria and applicable Puerto Rico noise ordinances. The following minimum treatments shall be provided:

1. Room walls and ceiling: Acoustically rated assembly with minimum STC (Sound Transmission Class) 55 for walls separating the Generator Room from occupied spaces or corridors; double-layer gypsum board or concrete masonry with resilient channels and acoustic batt insulation, or an engineered acoustic wall assembly per the project's acoustic engineer's design; all wall penetrations sealed with UL-listed acoustic firestopping.

2. Intake and exhaust louvers: Internally-lined acoustic louvers at all generator room combustion air intake and cooling air exhaust wall openings; acoustic lining shall not reduce the required free area for combustion and cooling air; insertion loss minimum 15 dB(A) across the louver.
3. Radiator discharge flexible connection: Canvas (neoprene-coated fabric) or elastomeric flexible duct connector between the generator radiator discharge and the room exhaust plenum or duct; flexible connector shall incorporate internal acoustic lining (minimum 1-inch thick fiberglass or mineral wool rated for airstream exposure) providing minimum 10 dB(A) insertion loss; connector absorbs fan-generated vibration and prevents rigid duct noise transmission; minimum connector length 18 inches to allow effective sound attenuation and vibration decoupling.
4. Exhaust silencer: Critical-grade silencer per Article 2.9; the exhaust silencer is the primary attenuation device for engine exhaust noise.
5. Vibration isolation: Anti-vibration isolators reduce structure-borne vibration transmission from generators to the building structure, which in turn reduces low-frequency noise radiation from floors, walls, and ceilings above.
6. Doors: Acoustic-rated doors (minimum STC 45) on all Generator Room access doors; gasketed and bottom-swept; self-closing; fire-rated per the room's two-hour fire rating requirement.

B. Noise Limit Objectives (Design Guideline):

1. Occupied spaces adjacent to Generator Room walls: ≤ 55 dB(A) measured in the adjacent space with all three generators at full load.
2. Building exterior at the property line: Comply with applicable Puerto Rico municipal noise ordinances for industrial noise during emergency operations.

C. ***NOTE:*** *These noise limits are design objectives subject to confirmation by the project acoustic engineer. The D&B Contractor shall retain or coordinate with a qualified acoustic engineer to verify compliance. Generator noise limits during emergency operation may be subject to regulatory exceptions in Puerto Rico; confirm with the local AHJ.*

2.12 GENERATOR ROOM - PHYSICAL REQUIREMENTS

A. The Basement Generator Room shall meet the following minimum physical and life safety requirements:

1. Fire rating: Two-hour fire-rated construction, walls, floor/ceiling assembly, and all penetrations; self-closing, automatic-closing fire-rated doors with panic hardware per NFPA 101.
2. Ventilation: Dedicated combustion air intake and heated air exhaust system designed by the Mechanical Engineer per engine air requirements; no HVAC recirculation to/from other building zones.

3. Floor: No floor drains inside the Generator Room per NEC requirements for electrical rooms; provide housekeeping floor sloped to a containment sump within the room for spill management.
4. Housekeeping pads: Reinforced concrete pads for each generator set; pads anchored with seismic anchor bolts per anchorage calculations.
5. Lighting: Minimum 30 fc (300 lux) at equipment maintenance level; emergency/exit lighting on the Life Safety Branch; wall-mounted industrial utility lighting fixtures with wire guards.
6. Seismic design: All equipment, pads, fuel storage, exhaust piping, and electrical equipment installed and anchored per Puerto Rico Building Code seismic requirements.
7. The paralleling switchgear (Section 16800) shall be located in a separate, two-hour fire-rated room adjacent to, but not within, the Generator Room.

2.13 APPROVED MANUFACTURERS:

A. MTU (Roll Royce Solutions)
B. Cummings
C. Caterpillar

PART 3 - EXECUTION

3.01 INSTALLATION - GENERAL

A. Install all equipment in accordance with manufacturer's instructions, this specification, NEC Article 445 (Generators), NFPA 37, NFPA 110 Level 1, and NFPA 99 Category 1 requirements.
B. Prior to connecting generators to the building's electrical system, obtain written approval from the Owner's Engineer and confirm all field acceptance tests are complete.
C. The NFPA 110 acceptance criteria apply at project completion - the system must demonstrate the 10-second start requirement, the correct load transfer sequence, and all protective functions before the Facility may occupy for clinical operations.

3.02 EQUIPMENT PADS AND ANCHORAGE

A. Complete all concrete pads and anchorage as follows:
    1. Complete all generator room concrete housekeeping pads and install anchor bolts before generator delivery.

2. Set generator sets on anti-vibration isolators; level each unit; torque anchor bolts through isolator base plates per manufacturer's specification; record torque values.
3. Install fuel day tanks on concrete pads within containment basins before fuel piping connection.

3.03 FUEL SYSTEM INSTALLATION

A. Install fuel system per NFPA 30 and NFPA 37:

1. Install all fuel piping per NFPA 30 and NFPA 37; slope piping for gravity drainage; support piping at maximum 8-foot intervals with pipe hangers.
2. Install flexible connections at the day tank fuel inlet and at the engine fuel inlet/return; use only fuel-resistant materials.
3. Install all fuel shutoff valves and emergency fusible-link shutoff valves per NFPA 37; label each valve with a permanent tag.
4. Install tank vent piping to the exterior of the building; terminate per NFPA 30 (minimum 12 inches above roof or grade, away from air intakes, openings, and ignition sources).
5. Install overfill prevention valves, leak detection sensors, and level gauges on each day tank and the bulk storage tank per supplier instructions.
6. Prior to fuel fill, pressure-test all fuel piping to 1.5x working pressure per NFPA 30; document and submit pressure test records.

3.04 EXHAUST SYSTEM INSTALLATION

A. Install exhaust system as follows:

1. Install exhaust flexible bellows connectors at the engine exhaust outlet; do not make rigid connections directly to the engine.
2. Install exhaust silencers in designated locations per shop drawings; support the silencer independently from exhaust piping to prevent pipe stress on the silencer housing.
3. Install all exhaust piping on spring-isolated pipe hangers; allow for thermal expansion at pipe bends and expansion joints.
4. Apply thermal insulation on all exhaust piping within the building; verify surface temperature ≤ 60°C on the insulation jacket after installation and full-load operation.
5. Install condensate drip legs and drain valves at low points; tag all drain valves.
6. Install rain cap or elbow at the exterior exhaust discharge; confirm discharge direction avoids the heliport FATO zone, building air intakes, and occupied grade-level areas.

3.05 ELECTRICAL CONNECTIONS

A. Install all electrical connections as follows:

1. Install generator output cables from each generator control panel/output terminals to the corresponding generator output breaker in the Section 16800 paralleling switchgear.
2. Install battery charger circuit from the Essential Electrical System branch panel to each generator battery charger.
3. Install block heater circuit from the Essential Electrical System branch panel to each generator block heater.
4. Install load-sharing and synchronizing signal cables between each generator control panel and the Section 16800 paralleling switchgear; use shielded twisted-pair cable per switchgear manufacturer's requirements; ground shields at one end only.

B. **REQUIRED:** Life Safety Branch wiring from the paralleling switchgear to the Life Safety ATS and from the ATS to Life Safety branch circuits shall be kept entirely separate and physically independent from Critical Branch, Equipment System, and Optional Standby wiring per NEC 700.10. Do not share conduit, cable tray, or wiring enclosures between the Life Safety Branch and any other branch.

3.06 GROUNDING

A. Install all grounding and bonding connections as follows:

1. Ground each generator alternator neutral solidly to the generator room ground bus; conductor size per NEC 250.30.
2. Ground generator enclosure (frame/baseframe) to the generator room ground bus; separate conductor from the neutral grounding.
3. Bond fuel day tanks and the bulk storage tank to the building ground system per NFPA 30 for static electricity control.

3.07 FIELD ACCEPTANCE TESTING

A. Perform the following acceptance tests with the Owner's Representative and Authority Having Jurisdiction (AHJ) present where required by NFPA 110. Submit a certified field acceptance test report before requesting clinical occupancy.

B. Visual Inspection and Pre-Start Checks (each generator):

1. Verify nameplate data matches specification and approved shop drawings.
2. Verify all accessories installed and connected: block heater, battery charger, exhaust silencer, flexible connectors, vibration isolators, fuel connections, level gauges, leak detectors.
3. Check engine oil level; check coolant level; verify fuel in day tank.

4. Verify battery connections; record battery voltage (must be ≥ 24 V DC with charger connected).
5. Verify block heater circuit energized; verify coolant temperature ≥ 90°F before test start.
6. Verify exhaust system complete and discharge unobstructed.
7. Verify generator room ventilation system operational and louvers open.

C. Individual Generator Set Tests:

1. Manual start test: Start each generator manually from the control panel; verify rated voltage and frequency within 10 seconds; verify no alarms or shutdowns; run 15 minutes at no-load; record voltage and frequency stability.
2. Automatic start test: With the generator set in AUTO mode, simulate a utility loss signal; verify automatic start and load readiness within 10 seconds; time and record.
3. Protective shutdown tests: Test each protective shutdown by simulation or injection - low oil pressure, high coolant temperature, overspeed, overcrank; verify correct shutdown and alarm annunciation; reset after each test.
4. Load test, individual generator: Apply 25%, 50%, 75%, and 100% of rated kW load in steps via portable load bank; record voltage and frequency at each load step; verify voltage regulation ±0.5%, frequency regulation ±0.5%; record fuel consumption data.
5. Block load test: Apply 100% rated load in a single step; verify voltage dip ≤ 15% and frequency dip ≤ 10%; verify recovery within 3 and 5 seconds respectively; record oscillograph or event recorder data.

D. Paralleling and Synchronizing Tests:

1. Two-generator parallel test: Start Generator 1; bring to rated output; start Generator 2; verify automatic synchronization and paralleling; verify load sharing (≤ 10% load deviation between units); verify no out-of-phase close occurs.
2. Three-generator parallel test: Start and parallel all three generators; verify load sharing among all three; verify bus frequency and voltage stability at full building load.
3. Load shedding test: With all generators paralleled at near-rated load, simulate generator overload by exceeding combined capacity; verify Optional Standby loads shed in sequence; verify Critical and Life Safety loads are NOT shed.
4. Loss-of-generator test: With two generators paralleled, trip one generator output breaker; verify the remaining generator picks up load; verify distribution breakers remain closed for all essential loads.

5. Run-hour equalization rotation test: Verify the paralleling controller assigns lead/lag/spare designations and commands the correct unit to start on simulated utility loss based on the programmed rotation schedule.
6. ABT scheme verification: Simulate utility failure with all generators in AUTO; verify the generator plant starts, paralleling occurs, ATSs transfer to the generator source, and time-to-load meets NFPA 110 Level 1 Type 10 requirements (full system load transfer within 10 seconds of start signal).

E. ATS Integration Test:

1. With all three generators paralleled, de-energize the utility source; verify each ATS transfers to the generator (emergency) source in the required sequence; record transfer times for the Life Safety and Critical Branch ATSs (must be ≤ 10 seconds for NFPA 110 Level 1).
2. Retransfer test: Restore the utility source; verify each ATS retransfers to utility in the correct sequence; verify generator plant cool-down and shutdown.

F. Fuel System Acceptance Test:

1. Fill each day tank to at least 50% capacity; verify fuel level gauge reads correctly.
2. Verify low fuel alarms at each day tank at the control panel.
3. Verify emergency fuel shutoff (fusible link) valves are correctly installed and labeled.
4. Submit fuel system pressure test records confirming all piping is leak-free.
5. Verify the bulk storage tank fuel level, leak detection, and alarm outputs at the BMS.

3.08 COMMISSIONING AND NFPA 110 INITIAL LOAD BANK TEST

A. Upon successful completion of all acceptance tests, perform the NFPA 110 initial full-load load bank test:

1. NFPA 110 Level 1 requires a minimum 2-hour full-load run of the complete EES; perform with the full building load plus portable load bank to reach 100% of installed generator rated capacity (or as directed by NFPA 110 and the AHJ).
2. Run two generators in parallel at 100% combined rated kW (3,500 kW) for a minimum 2 hours; cycle the third generator in during the test to verify paralleling at full load.
3. Monitor and record voltage, frequency, engine parameters (oil pressure, coolant temperature), fuel consumption, and ambient temperature every 15 minutes throughout the test.
4. Document and submit a full-load test report signed by the Contractor's licensed Electrical Engineer.

5. Schedule: Coordinate the load bank test with the Owner; the test shall occur before clinical occupancy.

3.09 TRAINING

A. Provide minimum eight (8) hours of on-site training for the Owner's Facilities Engineering staff, per Section 16100, Section 1.11. Training shall cover:

1. Generator start/stop: Manual start, manual stop, AUTO mode operation, emergency stop.
2. Paralleling switchgear: How to manually synchronize, how to read the synchroscope, load-share display, lead/lag/spare rotation, manual override of automatic controls.
3. Fuel system: Day tank and bulk storage tank fill procedures, fuel sampling procedure.
4. Alarm response: What each alarm means, what to do on each alarm, who to call.
5. Monthly exercise procedure: Step-by-step monthly test procedure per NFPA 110; documentation log requirements.
6. Annual load bank test: Scope of the annual test, how to coordinate with the AHJ, what documentation is required.
7. Emergency procedures: What to do if a generator fails during a utility outage; how to manually transfer between units.

3.10 CLOSEOUT SUBMITTALS

A. Submit the following closeout documents before substantial completion:

1. Certified field acceptance test report, all tests in Article 3.7, signed by a licensed Electrical Engineer.
2. NFPA 110 initial load bank test report, signed by a licensed Electrical Engineer and reviewed by the AHJ.
3. As-built drawings: Generator room layout, fuel system piping diagram, exhaust system diagram, wiring diagrams, final relay settings.
4. Fuel system pressure test records.
5. Battery installation and initial voltage records.
6. Generator room anchor bolt torque records.
7. Air permit from PREQB/JCA for three (3) diesel generators.
8. Fuel storage permit from the AHJ/PREQB for the bulk diesel storage tank, sized per the D&B Contractor's fuel consumption calculation to provide the minimum 5-day (120-hour) full-load reserve required by this Section.
9. O&M manuals for all equipment (generators, fuel system, exhaust system).

10. Training completion record with attendee signatures and topics covered.
11. Spare parts list and location of initial spare parts inventory.

5.0 MECHANICAL PRELIMINARY TECHNICAL SPECIFICATIONS

MECHANICAL SYSTEMS PRELIMINARY TECHNICAL SPECIFICATIONS

Fire Suppression · Plumbing · HVAC · Medical Gases

RFP / DESIGN-BUILD USE NOTICE

These mechanical preliminary technical specifications are revised for use as RFP/bridging performance criteria for the selection of a Design-Build Entity for the New Puerto Rico Trauma Hospital. They establish minimum architectural requirements, quality criteria, design intent and coordination expectations, and are not issued as final permit or construction specifications by themselves.

The selected Design-Build Entity shall verify existing and proposed conditions, coordinate all disciplines, perform required engineering and code analysis, prepare and submit the final permit and construction documents, and obtain all required approvals through Puerto Rico licensed design professionals of record.

References in these sections to “Contractor” mean the selected Design-Build Entity after award. References to “Architect,” “Engineer,” “A/E,” “Resident Engineer,” or similar review parties mean the applicable Design Professional(s) of Record and/or ASEM/Owner review representative, as applicable under the RFP and final Design-Build Agreement.

Named products, manufacturers and details are minimum quality benchmarks unless the RFP expressly states otherwise. Proposed equals, substitutions, delegated design items, shop drawings, product data and samples shall demonstrate compliance with the RFP Bridging Documents, applicable codes, healthcare requirements and the final Design-Build Agreement.

FIRE SUPPRESSION SYSTEMS

SECTION 21 05 00 COMMON WORK RESULTS FOR FIRE SUPPRESSION

PART 1 — GENERAL

1.01 SUMMARY

A. This Section includes common requirements for fire suppression systems that apply to other fire suppression Sections.

B. The fire suppression systems shall serve the Puerto Rico Trauma Hospital (ASEM), a 215,880 SF, 10-story Risk Category IV healthcare facility at Centro Médico, San Juan, Puerto Rico. The facility shall be treated as a fully sprinklered healthcare occupancy per NFPA 101.

1.02 REFERENCES

A. NFPA 13 — Standard for the Installation of Sprinkler Systems, latest edition.

B. NFPA 14 — Standard for the Installation of Standpipe and Hose Systems, latest edition.

C. NFPA 20 — Standard for the Installation of Stationary Pumps for Fire Protection, latest edition.

D. NFPA 24 — Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

E. NFPA 72 — National Fire Alarm and Signaling Code (coordination only).

F. NFPA 101 — Life Safety Code.

G. Puerto Rico Building Code (PRBC) — latest adopted edition.

H. FM Global / UL Listings — All equipment listed and approved for intended service.

1.03 SURGE DESIGN BASIS

A. All fire suppression systems shall be designed for the surge occupancy of 182 beds (two beds per patient room). Fire protection occupant load calculations per NFPA 101 shall reflect surge bed count.

1.04 SUBMITTALS

A. Shop Drawings: Complete hydraulic calculations, equipment layouts, riser diagrams, and material specifications for all fire suppression systems.

B. Product Data: Manufacturer's data sheets and listings for all sprinkler heads, fire pumps, valves, and accessories.

C. Water Supply Analysis: Flow test data from ASEM water main at the point of connection, demonstrating adequate supply for system demand plus 10% safety margin.

D. Coordination Drawings: Coordinated with all other MEP trades to confirm clearances and access.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Licensed fire protection contractor in Puerto Rico with minimum 5 years of healthcare facility experience.

B. All work shall be performed in compliance with the AHJ and ASEM facilities requirements.

C. Hydraulic calculations shall be prepared by a NICET Level III certified fire protection technician or licensed PE.

END OF SECTION 21 05 00

SECTION 21 12 00 FIRE SUPPRESSION STANDPIPES

PART 1 — GENERAL

1.01 SUMMARY

A. Provide Class I automatic wet standpipe system per NFPA 14 throughout the 10-story building. The system shall have one dedicated riser per stairwell (two risers total), base-interconnected with isolation valves.

1.02 SYSTEM DESCRIPTION

A. System Type: Class I per NFPA 14. The building is fully sprinklered per NFPA 13; Class I standpipe provides fire department hose connections only.

B. Two (2) standpipe risers — one per stairwell (Stair 1 and Stair 2) — interconnected at the base with the fire main header fed from the fire pump discharge.

C. Fire Department Connection (FDC / Siamese): Two (2) exterior two-way Siamese connections at the building perimeter, accessible to fire department apparatus, with check valve and automatic ball drip per NFPA 14. Required — not optional.

PART 2 — PRODUCTS

2.01 STANDPIPE HOSE VALVES

A. 2-1/2" angle hose valves, UL listed, at each floor landing in each stairwell.

B. Valves: Cast iron or brass body, wheel handle, with cap and chain.

C. Pressure-reducing valves where required by NFPA 14 to limit residual pressure.

2.02 PIPING

A. Schedule 40 black steel, ASTM A53 / A135, with grooved or threaded fittings.

B. Minimum pipe size: 4" for standpipe risers; 2-1/2" for branch lines to hose valves.

PART 3 — EXECUTION

3.01 INSTALLATION

A. Install per NFPA 14. All valves supervised open with tamper switches connected to fire alarm system per NFPA 72.

B. Conduct hydrostatic test at 200 psi for 2 hours or 50 psi above working pressure, whichever is greater.

END OF SECTION 21 12 00

SECTION 21 13 13 WET-PIPE FIRE SUPPRESSION SPRINKLERS

PART 1 — GENERAL

1.01 SUMMARY

A. Provide complete automatic wet-pipe fire suppression sprinkler system per NFPA 13 throughout the entire facility. Pre-action systems shall be provided in electrical rooms and data/server rooms.

1.02 SYSTEM DESCRIPTION

A. Water supply from ASEM main water ring via dedicated 4" fire service meter. Fire cistern 36,000 gallons supplemented by rainwater collection.

B. Hazard classification: Light Hazard — patient rooms, corridors, administrative. Ordinary Hazard Group 1 — mechanical/utility rooms, storage. Special hazard provisions for OR areas per NFPA 99 Chapter 14.

C. Design density: Light Hazard per NFPA 13 Table 11.2.3.1.2 over the most hydraulically demanding design area.

PART 2 — PRODUCTS

2.01 FIRE PUMP

A. Type: Diesel engine-driven, split-case horizontal centrifugal, listed per NFPA 20.

B. Performance: 1,000 GPM at 150 PSI rated working pressure.

C. Diesel Tank: Integral, minimum 500-gallon capacity (minimum 8-hour run time at rated load).

D. Jockey (pressure maintenance) pump: Automatic electric-driven.

E. Fire pump room: 2-hour fire-rated construction, dedicated ventilation, and drainage pit. Located in Basement level.

2.02 SPRINKLER HEADS

A. Quick-response type in all occupied areas per NFPA 13.

B. Concealed type with painted cover plate in all patient care areas, corridors, and public spaces.

C. Upright/pendent type in mechanical rooms and storage areas.

D. ESFR heads where required for high-piled storage areas.

E. No sprinklers in: electrical switchgear rooms, transformer vaults, MRI rooms — provide alternative protection as required by AHJ.

2.03 PIPING

A. Schedule 10 carbon steel, Victaulic grooved-end for mains; Schedule 40 where required by code.

B. No plastic pipe in clinical areas. Stainless steel where exposed in sterile environments.

2.04 FIRE CISTERN

A. Underground reinforced concrete, 36,000-gallon capacity, dedicated to fire protection only.

B. Fed from ASEM water main and supplemental rainwater collection.

C. Seismic design coordinated with structural engineer. Low-level alarm connected to fire alarm panel and BMS.

PART 3 — EXECUTION

3.01 INSTALLATION

A. Install per NFPA 13. Hydraulic calculations required for all systems.

B. All control valves supervised open with tamper switches reporting to fire alarm panel per NFPA 72.

C. Flow switches at each floor and zone, waterflow alarms reporting to fire alarm panel.

D. Fire pump controller: Listed per NFPA 20; all alarms (pump start, loss of power, phase failure) reporting to fire alarm and BMS.

3.02 TESTING

A. Hydrostatic test at 200 psi for 2 hours.

B. Water supply flow test from ASEM water main prior to design completion.

C. All tests witnessed by AHJ and Owner's representative.

END OF SECTION 21 13

PLUMBING SYSTEMS

SECTION 22 05 00 COMMON WORK RESULTS FOR PLUMBING

PART 1 — GENERAL

1.01 SUMMARY

A. This Section includes common requirements applicable to all specified plumbing work.

B. The plumbing systems shall serve a 215,880 SF, 10-story healthcare facility. All systems shall comply with the FGI Guidelines for Design and Construction of Hospitals (latest edition), the Puerto Rico Plumbing Code, and all referenced standards.

1.02 REFERENCES

A. FGI Guidelines for Design and Construction of Hospitals — latest edition.

B. International Plumbing Code (IPC) as adopted by Puerto Rico.

C. ASSE 1010, 1017, 1070 — Plumbing device standards.

D. ASHRAE 188 — Legionellosis: Risk Management for Building Water Systems.

E. ASTM B88 — Copper Water Tube. ASTM D2665 — PVC Drain Pipe. AWWA C-151 — Ductile Cast Iron Pipe.

F. NFPA 54 — National Fuel Gas Code (LPG). NFPA 58 — LP-Gas Code (storage).

1.03 SURGE DESIGN BASIS

A. All plumbing systems shall be sized for surge occupancy of 182 beds (two beds per patient room). Domestic water demand calculations, fixture unit counts, pipe sizing, and booster pump capacity shall be based on surge occupancy.

1.03b EQUIPMENT PROPOSALS — OWNER APPROVAL REQUIRED

A. These are performance-based specifications for a Design-Build RFP. No plumbing equipment, fixtures, or materials are pre-specified by manufacturer, brand, or model number for the plumbing systems.

B. The D&B Contractor shall propose all plumbing equipment and materials that meet or exceed the requirements specified herein and shall submit complete product data to the Owner and Engineer for written approval PRIOR to procurement or installation. No equipment shall be ordered without prior written approval.

C. There are no alternates or substitutions since no base product is specified. All proposed equipment is subject to Owner/Engineer approval.

1.04 PIPING MATERIALS — PLUMBING PIPE MATERIAL SCHEDULE

All piping materials shall conform to the following schedule:

Type of Service	Min Dia.	Max Dia.	Aboveground	Underground	Fitting Characteristics
City Water Hot or Cold	1/2"	2"	Rigid Copper Typ. L Seamless ASTM B88	Rigid Copper Typ. K Seamless ASTM B88	Welded or Viega Propress
	2-1/2"	4"	Ductile Cast Iron AWWA C-151	Ductile Cast Iron AWWA C-151	
Sanitary and Ventilation	2"	6"	PVC SCH 40 DR22 ASTM D2665	4" <=PVC SCH 40 6" >=SDR 14-PR	Glue or Compressions Welded

END OF SECTION 22 05 00

SECTION 22 05 13 GENERAL REQUIREMENTS FOR PLUMBING WORK

PART 1 — GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions, Supplementary General Conditions, Special Conditions, and applicable General Requirements Specification sections apply to this Section.

B. All requirements of Section 22 05 00 — Common Work Results for Plumbing — apply to this Section. This Section incorporates the General Plumbing Specifications, adapted and updated to CSI MasterFormat 2020 and project-specific requirements for the Puerto Rico Trauma Hospital.

1.02 DEFINITIONS

A. "Contractor" or "Plumbing Contractor" refers to the D&B Contractor's plumbing subcontractor or the plumbing trade performing the specified plumbing work.

B. "Engineer" refers to the Mechanical Engineer of Record (PE licensed in Puerto Rico, CIAPR member) responsible for the plumbing design of this project.

C. "Approved Equal" means any equipment or material that, in the opinion of the Engineer, is equal in quality, durability, appearance, strength, design, and performance to the equipment or material specified, and will function adequately in accordance with the proposed design.

1.03 SUMMARY — SCOPE OF PLUMBING WORK

A. The plumbing work shall include a complete, tested, and ready-for-operation plumbing system as shown on the drawings and specified herein, including: (1) Potable water service from ASEM water main with new meter; (2) Potable water cistern 30,000 gal with chlorination; (3) VFD booster pump system for flush-valve demand; (4) Dual-zone pressure risers (CW, HWS, HWR) for Floors 1–4 and 5–9; (5) LPG-fired domestic hot water heaters N+1; (6) Sanitary drainage, waste, and vent systems; (7) Fire service from ASEM water main with dedicated 4" fire meter; (8) Medical gas systems per NFPA 99 Category 1; (9) All plumbing fixtures, trim, and accessories. Surge design basis: all systems sized for 182 beds (two beds per room).

B. Any equipment or material shown on drawings and not mentioned in specifications, or vice versa, and all accessories and minor details not shown but necessary to complete the work and provide a system ready for operation, shall be provided by the Contractor without additional expense to the Owner.

C. The Contractor shall provide all supervision, labor, material, equipment, machinery, plant, and any and all other items necessary to complete the plumbing system.

1.04 INTERPRETATION OF DRAWINGS AND SPECIFICATIONS

A. The specifications and drawings are intended to agree with each other and to be mutually explanatory and complementary. The work shall be performed as called for by both. Any disagreement arising from these specifications shall be decided by the Engineer, whose interpretation is final.

B. In cases of disagreement between drawings and specifications, or within either document itself, or between one trade and another, the better quality, greater quantity, or more costly work shall be included in the contract price; the matter shall be referred to the Engineer for decision and/or adjustment.

C. Drawings are diagrammatic and indicate the general arrangement of systems. Drawings are not to be scaled. The Contractor shall follow drawings in laying out work, check drawings of other trades to verify available spaces, and maintain maximum headroom at all points. Where headroom or space conditions appear inadequate, the Engineer shall be notified before proceeding.

D. If directed by the Engineer, the Contractor shall make reasonable modifications in the layout as needed to prevent conflict with other trades or for proper execution of the work, without extra charge.

E. All items of equipment are specified as singular items; however, the Contractor shall provide and install the number of items of equipment as indicated on the drawings and required for complete systems. The Contractor shall determine from the drawings the exact number of units required.

1.05 QUALITY ASSURANCE

A. Submission of an unqualified proposal commits the Contractor to perform all work expressed in the drawings and specifications without additional compensation. Such submission commits the Contractor, without extra compensation, to: (1) abide by all rules and regulations of authorities having jurisdiction; (2) provide every item of work required to complete intended installations; (3) coordinate work with other trades to prevent conflicts.

B. All plumbing work shall be performed by licensed plumbing contractors in Puerto Rico. ASPE (American Society of Plumbing Engineers) recommended practices shall be followed throughout.

1.06 REGULATORY REQUIREMENTS

A. The Contractor shall give all necessary notices, obtain all permits, and pay all government sales taxes, fees, and other costs, including utility connections and extensions. All permits shall be delivered to the Engineer before requesting acceptance and final payment.

B. The Contractor shall include in the work, without extra cost to the Owner, all labor, materials, services, apparatus, and drawings required to comply with all applicable laws, ordinances, rules, and regulations, whether or not shown on drawings and/or specifications.

C. All plumbing work shall comply with: Puerto Rico Plumbing Code, IPC, FGI Guidelines, NFPA 99 (medical gases), ASHRAE 188 (Legionella), ASSE 1010/1017/1070, NFPA 13/14/20 (fire protection), NFPA 54/58 (LPG), and all referenced standards in Section 22 05 00.

1.07 FIELD MEASUREMENTS

A. The Contractor shall visit the site and base all measurements, both horizontal and vertical, from established benchmarks. The work shall agree with these established lines and levels.

B. Should the Contractor discover any discrepancy between actual measurements and those indicated that prevents following good practice or the intent of the drawings and specifications, the Engineer shall be notified, and the Contractor shall not proceed until receiving instructions from the Engineer. No allowance will be granted for failure to visit the site.

1.08 WARRANTY

A. The Contractor shall leave the entire plumbing installation in proper working condition and shall, without additional cost, replace all work, material, and/or equipment or any part thereof that develops defects (except from ordinary use) within five (5) years from the date of final approval for equipment under 5 tons, and one (1) year for equipment above.

B. The Contractor shall be responsible for all damages resulting from defective material and/or equipment and shall repair or replace injuries to existing work caused by such defects without additional charges to the Owner.

C. The Contractor shall furnish manufacturer certificates or guarantees to the effect that they will furnish new parts, materials, or equipment where defects occur due to faulty manufacture for a period of one (1) year from the date of final approval.

1.09 SUBMITTALS

A. Product Data: Manufacturer's data sheets, performance curves, and certifications for all major plumbing equipment and fixtures.

B. Shop Drawings: Complete plumbing riser diagrams, fixture schedules, pipe sizing calculations, and coordination drawings coordinated with all other MEP trades.

C. Calculations: Water demand calculations based on surge occupancy (182 beds); hydraulic calculations for booster pump sizing; pipe sizing calculations for both pressure zones.

D. Submit all items for Engineer review minimum 30 days before fabrication, procurement, or delivery.

PART 2 — PRODUCTS

2.01 EQUIPMENT — GENERAL

A. All equipment and materials required for the work, except as specifically specified otherwise, shall be new, of first-class quality, and shall be furnished, delivered, erected,

connected, and complete in every detail. Where no specific kind or quality of material is given, a first-class standard article as approved by the Engineer shall be furnished.

B. The Contractor shall locate all equipment that must be serviced, operated, or maintained in fully accessible positions, including valves, traps, motors, controllers, switchgear, and drain points. Access doors shall be provided where required for better accessibility.

2.02 EQUIPMENT PROPOSALS AND OWNER APPROVAL

A. No equipment is pre-specified by manufacturer or model in these specifications. These are performance-based specifications for a Design-Build RFP. The Contractor shall propose all equipment that meets or exceeds the performance, efficiency, acoustic, seismic, code, and material requirements specified herein.

B. The Contractor shall submit complete product data, performance data, shop drawings, and calculations for ALL proposed equipment to the Owner and Engineer for review and approval PRIOR to procurement, fabrication, or installation. No equipment shall be ordered or installed without prior written approval from the Owner and Engineer.

C. Since no base equipment is specified, there are no alternates or substitutions. All proposed equipment is subject to Owner/Engineer approval based on compliance with these performance specifications. The Contractor shall not propose equipment that does not fully comply with all requirements herein.

D. Should any approved equipment subsequently prove defective or unsatisfactory, the Contractor shall, without cost to the Owner, replace it with equipment meeting the original performance specifications and re-submit for Owner approval.

E. Where the proposed equipment requires any redesign of structure, partitions, foundations, piping, or wiring, all such redesign and new drawings shall be prepared by the Contractor at their own expense and approved by the Engineer before proceeding. All additional piping, structural supports, insulation, controls, motors, starters, and electrical wiring required shall be furnished and installed at no additional cost to the Owner.

PART 3 — EXECUTION

3.01 SYSTEM INSTALLATION

A. The installation of plumbing systems shall be performed by experienced personnel under the supervision of competent foremen, in accordance with ASPE recommended practices and those of the manufacturers of the equipment and materials involved, to obtain a functional and neat installation.

B. The Engineer shall have the privilege of stopping any work or use of material that in the Engineer's opinion is not being properly installed. The Contractor shall remove all material delivered and work erected that does not comply with the contract drawings, at no additional cost to the Owner.

3.02 FOUNDATIONS, SUPPORTS, PIERS, AND ATTACHMENT

A. The Contractor shall furnish and install all necessary foundations, supports, pads, bases, and piers required for all plumbing equipment and piping. All concrete pads shall extend 4" beyond machine base in all directions with top edge chamfered. Insert 3" steel dowel rods into floors to anchor pads. Shop drawings for all foundations and pads shall be submitted to the Engineer for approval before construction.

B. Construction of foundations, supports, pads, bases, and piers where mounted on the floor shall be of the same materials and same quality of finish as the adjacent surrounding flooring material. All equipment shall be securely attached to the building structure in an approved manner.

3.03 CUTTING AND PATCHING

A. The Contractor shall provide all cutting and patching necessary to install the work specified in this Section. Patching shall match adjacent surfaces. No structural members shall be cut without the approval of the structural engineer.

3.04 ELECTRICAL CONNECTIONS

A. The Contractor shall furnish and install all power wiring complete from the power source to each motor or equipment junction box, including power wiring through starters. The Contractor shall install all starters not factory-mounted on equipment.

B. The Contractor shall, regardless of voltage, furnish and install all temperature control wiring for all plumbing equipment. After all circuits are energized and completed, the Contractor shall be responsible for all power wiring.

3.05 INTERRUPTION OF EXISTING SERVICES

A. Whenever the work performed under this Section makes mandatory the interruption of existing services, such work shall be performed at a time that causes the least conflict with ongoing hospital operations. All interruptions shall be coordinated with the General Construction Supervisor and ASEM facilities management. Work shall be performed continuously, including labor after hours and overtime as required.

B. This requirement is critical given the project's location on the active ASEM campus — any interruption to water, drainage, or medical gas services in adjacent occupied hospital buildings must be coordinated at minimum 72 hours in advance with ASEM facilities management and ICRA/ILSM plan approval.

3.06 CLEANING AND PROTECTION

A. All piping and equipment shall be thoroughly cleaned of foreign substances inside and out before the system is placed in operation. During construction, open ends of piping shall be protected by temporary covers or sealed to prevent entry of foreign elements including moisture.

B. If foreign matter should stop any part of the system after being placed in operation, the system shall be disconnected and cleaned wherever necessary to locate and remove obstructions. All work damaged in the course of removing obstructions shall be repaired and replaced at no additional cost to the Owner.

C. The Contractor shall protect all work and material from damage by their work or workmen, and shall be responsible for all work and equipment until finally inspected, tested, and accepted. The Contractor shall protect work against theft, injury, and damage, and shall carefully store material and equipment received at the site that is not immediately installed.

3.07 SCAFFOLDING, RIGGING, AND HOISTING

A. The Contractor shall furnish all scaffolding, rigging, and hoisting services necessary for the erection and delivery into the premises of any equipment and apparatus furnished. All scaffolding shall be removed from the premises when no longer required.

3.08 FIELD QUALITY CONTROL

A. The Contractor shall furnish the services of an experienced superintendent who shall be constantly in charge of the installation of the work, together with all skilled workmen, fitters, metal workers, welders, helpers, and labor required to unload, transfer, erect, connect, adjust, start, operate, and test each system. The Engineer shall have the privilege of stopping any work not being properly installed.

3.09 COORDINATION OF TRADES

A. The Contractor shall give full cooperation to other trades and shall furnish in writing all information necessary to permit the work of other trades. The Contractor shall coordinate all plumbing work with architectural, structural, electrical, HVAC, fire protection, and medical gas trades. Submit coordination drawings in BIM (Revit preferred) for Owner review.

3.10 QUIET OPERATION AND VIBRATION CONTROL

A. All plumbing work shall operate under all conditions of load without any sound or vibration that is objectionable in the opinion of the Engineer. Conditions considered objectionable by the Engineer shall be corrected in an approved manner at the Contractor's expense. Vibration control shall be by means of approved vibration eliminators as recommended by the manufacturer.

B. Particular attention shall be directed to preventing noise and vibration transmission from mechanical equipment rooms to adjacent occupied areas. The Contractor shall incorporate vibration isolator bases, sound absorber pads, and sound insulation as required. This applies to equipment suspended in ceilings or mounted on roof. Rubber-in-shear isolators: single type designed for 1/4" deflection; double type for 1/2" deflection under imposed load. All vibration isolation systems shall be installed per manufacturer's instructions.

3.11 PAINTING

A. All outdoor plumbing equipment, hangers, and other metallic surfaces (except aluminum and copper) shall be wire-brushed, cleaned, and painted with two (2) coats of anticorrosion primer (Rust-Oleum 1069 Red Primer or approved equal). Final color as indicated by the Architect.

B. All interior plumbing equipment, hangers, and other metallic surfaces (except aluminum, copper, and stainless steel) shall be wire-brushed, cleaned, and painted with one (1) coat of anticorrosion primer (Rust-Oleum 769 Red Primer or approved equal). Final color as indicated by the Architect.

3.12 TESTS

A. All piping and equipment shall be tested as specified under the various Sections of work. Additional tests shall be provided as required for approval by agencies having jurisdiction. All labor, materials, instruments, and power required for testing shall be furnished by the Contractor.

B. Tests shall be performed in the presence of and to the satisfaction of the Engineer and such other parties as may have legal jurisdiction. All defective work shall be promptly repaired or replaced, and the test repeated until the system receives approval. All damages resulting from tests shall be repaired and damaged materials replaced.

C. Specific test requirements: (1) Cold water distribution — 150% of working pressure, minimum 150 psi, for 4 hours; (2) Hot water system — same pressure; verify recirculation maintains 120°F minimum at most remote point; (3) Sanitary drainage — hydrostatic test (fill to top of highest vent) or air test at 5 psi for 15 minutes; (4) Medical gas piping — per NFPA 99 (blowdown, pressure test, cross-connection, purity, flow tests); (5) Fire protection piping — 200 psi for 2 hours.

3.13 WATERPROOFING

A. Where any plumbing work passes through waterproofing, including waterproof concrete, the method of installation shall be approved by the Engineer before work is done. The Contractor shall furnish all necessary caulking and flashing required to make all openings absolutely watertight — especially critical for all penetrations in Puerto Rico's hurricane-exposed environment.

3.14 TESTING AND BALANCING

A. Testing and balancing of all domestic water and plumbing systems shall be accomplished as follows: (1) obtain the required water flow quantities at various operating conditions demonstrating compliance with the design, including simulation of flush-valve peak demand; (2) obtain the condenser and chilled water quantities required by the various components (coordinated with Section 23 23 00); (3) verify hot water recirculation system balance and 120°F minimum temperature at most remote point per zone.

B. All testing and balancing work shall be performed by an independent NEBB-certified test and balance agency under direct supervision of a qualified Engineer approved by the Owner. All instruments shall have been accurately calibrated within the last six (6) months (affidavits of calibration shall be furnished to the Owner's Engineer). The TAB Contractor and Owner Representative shall meet at least two (2) weeks prior to the anticipated start of testing to finalize procedures.

C. Testing and balancing shall not begin until systems have been completed and are in full working order. The Plumbing Contractor shall put all plumbing equipment into full operation and shall continue operation during each working day of testing and balancing.

D. The TAB Contractor shall include an extended warranty of ninety (90) days after completion of test and balance work and submission of the report, during which the Owner's Representative may request a recheck or resetting of any component.

E. Upon completion, the TAB Contractor shall submit seven (7) copies of the balance report plus one marked-up set of plumbing drawings indicating test point locations.

3.15 FINAL INSPECTION

A. The Contractor shall arrange and schedule final inspection of all plumbing work and shall notify the Engineer in writing that the Contractor has thoroughly checked the work and it is, in the opinion of the Contractor, ready for final inspection.

B. During the entire period scheduled for final inspections, the General Contractor, the Plumbing Subcontractor, and representatives of each manufacturer of equipment involved shall be present. All organizations shall have sufficient and competent personnel present so that adjustments can be made to all systems.

C. Final inspection shall include a record of water flow quantities to each zone, balancing of systems, proper function of each piece of electrical equipment, and individual system performance verification including: cistern level monitoring alarms, booster pump performance under flush-valve demand, hot water recirculation temperature by zone, chlorination residual, and BMS data point verification.

3.16 OPERATING AND MAINTENANCE MANUALS

A. The Contractor shall deliver to the Owner five (5) copies of all operating and maintenance manuals for each piece of equipment installed on the project. Manuals shall include: manufacturer's installation, operation, and maintenance instructions; complete list of all spare parts and replacements; recommended maintenance schedules; emergency shutdown and restart procedures; warranty certificates.

B. The Owner shall receive all equipment operating handbooks prior to the final acceptance and training phase.

C. The Contractor shall provide minimum eight (8) hours of Owner staff training on the potable water and plumbing systems (cistern, booster pumps, BMS monitoring, LPG hot water heaters, chlorination system) before final acceptance.

END OF SECTION 22 05 13

SECTION 22 11 00 FACILITY WATER DISTRIBUTION

PART 1 — GENERAL

1.01 SUMMARY

A. Provide domestic cold and hot water distribution systems including cistern, booster pumps, dual-zone pressure risers, recirculation, and all appurtenances for the complete facility.

1.02 SYSTEM DESCRIPTION

A. Water Supply: From ASEM main water distribution ring at main street. Contractor shall provide new potable water meter and service connection from the ASEM water main.

B. Cistern: 30,000-gallon potable water storage cistern. Reinforced concrete, seismic design. Continuous BMS level monitoring with high/low alarms.

C. Chlorination: Automatic chlorination system required — continuous dosing with residual analyzer and BMS low-residual alarm.

D. Pressure Zones: Two independent distribution zones — Low Zone (Floors 1–4) and High Zone (Floors 5–9). Each zone served by independent risers: one CW riser, one HWS riser, one HWR recirculation riser.

E. Fixtures: Flush valve (flushometer) type for all water closets and urinals. Booster system sized for flush-valve peak instantaneous demand. No gray water system — all fixtures served from potable supply.

PART 2 — PRODUCTS

2.01 BOOSTER PUMP SYSTEM

A. Type: Variable-speed (VFD) booster pump set — duty plus standby. Sized for flush-valve peak demand at surge occupancy.

B. Minimum inlet pressure at all flush valves: 25–35 psi residual. Maximum system pressure: 80 psi with PRVs per ASSE 1003.

C. BMS connection required: monitor pressure, flow, pump status, VFD speed, with alarms for low pressure, pump failure, and standby pump activation.

D. Hydropneumatic tank to absorb flush-valve flow spikes.

2.02 DOMESTIC HOT WATER

A. Generation: LPG (propane)-fired water heaters, N+1 configuration, 120°F minimum. LPG storage tank per NFPA 58, piping per NFPA 54.

B. Distribution: Recirculating system with dedicated HWS and HWR risers per pressure zone (two HWS + two HWR risers total). Maximum 0.5-gallon wait time at fixture per FGI.

C. Legionella Control: Per ASHRAE 188. Thermal disinfection (periodic flush at 160°F) per zone. BMS temperature monitoring.

D. Mixing: Thermostatic mixing valves (ASSE 1017) at all patient-accessible fixtures — 110°F maximum at patient showers and lavatories.

2.03 PIPE INSULATION — PLUMBING PIPING INSULATION SCHEDULE

Hot water piping shall be insulated as follows:

Temp (F)	Min Dia.	Max Dia.	Thickness	K Value	Material	Exterior Finish	Int. Exposed Finish
HW 100–120F	1/2"	1-1/2"	**1"**	K=0.22 BTU-IN/FT-H @75F	Rigid Fiberglass Micro-Lok by Johns Manville	6 oz. Canvas + MON ECO 55-50 Mastic + 0.016" Alum. Jacket w/VB Foil	MON ECO 55-50 + Manville Zeston PVC 30 MLS White. FS<=25/SD<=50 ASTM E84
	2"	3"	**1"**				
	4"	8"	**1.5"**				

2.03 PLUMBING PIPING INSULATION SCHEDULE — HOT WATER

All domestic hot water supply and return piping shall be insulated per the following schedule. Flame Spread <=25 / Smoke Dev. <=50 per ASTM E84.

Temp (F)	Min Dia.	Max Dia.	Thickness	K Value	Material	Exterior Finish	Int. Exposed Finish
HW 100-120F	1/2"	1-1/2"	**1"**	K=0.22 BTU-IN/FT-H@75F	Rigid Fiberglass Micro-Lok by Johns Manville	6 oz. Canvas + MON ECO 55-50 Mastic + 0.016" Alum. Jacket w/VB Foil	MON ECO 55-50 + Manville Zeston PVC 30 MLS White Gloss. FS<=25/SD<=50 ASTM E84
	2"	3"	**1"**				
	4"	8"	**1.5"**				

PART 3 — EXECUTION

3.01 INSTALLATION

A. All joints in copper water piping shall be brazed (hard solder) or Viega Propress press-fit connections. Lead-free solder only where soft solder is permitted.

B. Install anti-scald devices, backflow preventers, and pressure reducing valves per ASSE standards and code requirements.

C. Flush all systems with prior to disinfection. Disinfect per AWWA C651 and local health department requirements.

3.02 TESTING

A. Test cold water distribution at 150% of working pressure, minimum 150 psi, for 4 hours.

B. Test hot water system at same pressure. Verify recirculation system maintains minimum 120°F at most remote point.

C. Perform flush-valve flow tests to verify booster pump performance at peak demand.

END OF SECTION 22 11 00

SECTION 22 13 00 FACILITY SANITARY SEWERAGE

PART 1 — GENERAL

1.01 SUMMARY

A. Provide complete sanitary drainage, waste, and vent (DWV) systems for the facility, including floor drains, cleanouts, roof drains, acid waste, and grease interceptor.

1.02 SYSTEM DESCRIPTION

A. Sanitary drainage within the building (aboveground): PVC Schedule 40 DR22 ASTM D2665.

B. Below-slab and underground sanitary piping: 4" and smaller — PVC SCH 40; 6" and larger — SDR 14-PR; continuing to exterior manhole connection.

C. Vent system: Individual and circuit venting per code. All roof vent terminal penetrations minimum 10 feet from any air intake.

D. Acid waste: Polypropylene or PVDF piping for laboratory and imaging department sinks. Neutralization tank before connection to sanitary system.

E. Grease interceptor: Required for cafeteria/kitchen waste per local authority requirements.

PART 2 — PRODUCTS

2.01 FLOOR DRAINS

A. Floor drains in all soiled utility rooms, janitor closets, equipment rooms, ORs, procedure rooms, and bathrooms. Deep-seal trap (4" minimum) with trap primer where drains may dry out.

PART 3 — EXECUTION

3.01 INSTALLATION

A. All underground piping bedded in granular material per code. Maintain minimum slope of 1/4" per foot for 4" and smaller; 1/8" per foot for 6" and larger.

B. Cleanouts at all changes of direction greater than 45°, at base of each stack, and at 100-foot maximum intervals.

3.02 TESTING

A. Hydrostatic test: Fill system to top of highest vent; maintain for 15 minutes with no visible leakage.

B. Air test: 5 psi for 15 minutes where hydrostatic test is not practical.

END OF SECTION 22 13 00

SECTION 22 63 00 GAS SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES — MEDICAL GASES

PART 1 — GENERAL

1.01 SUMMARY

A. Provide complete medical gas and vacuum piping systems including source equipment, distribution piping, zone valves, outlet stations, master alarm systems, and area alarms per NFPA 99 Category 1 (Hospital level) requirements.

B. This is a life-safety system. All work shall comply with NFPA 99 (latest edition), FGI Guidelines, and local Puerto Rico Department of Health regulations.

1.02 MEDICAL GASES REQUIRED

A. Medical Oxygen (O_2) — Green piping.

B. Medical Vacuum (VAC) — White piping.

C. Medical Air (MA) — Yellow piping.

D. Nitrous Oxide (N_2O) — Blue piping (ORs and procedure rooms).

E. Nitrogen (N_2) — Black piping (ORs — surgical power tools).

F. Waste Anesthesia Gas Disposal (WAGD) — Magenta piping (all ORs and anesthetizing locations).

1.03 QUALIFICATIONS

A. Medical gas installer: ASSE 6010 certified.

B. Medical gas inspector: ASSE 6020 certified.

C. Final certification: Independent third-party Medical Gas Systems Verifier, ASSE 6030 certified. The verifier shall be independent of the installing contractor per NFPA 99. Required prior to Owner acceptance and system activation.

1.04 SURGE DESIGN BASIS

A. All patient room outlet stations shall be double stations (two outlets per gas per room) to accommodate surge capacity of two beds per room per NFPA 99.

B. Source equipment capacity (PSA oxygen, medical air compressors, vacuum pumps) shall be verified against simultaneous surge demand including potential for multiple patients on mechanical ventilation.

PART 2 — PRODUCTS

2.01 MEDICAL OXYGEN — PSA GENERATION PLANT

A. On-site Pressure Swing Adsorption (PSA) oxygen generation plant, duplex N+1 generators, automatic alternating. Each generator sized for 100% of peak demand independently.

B. Purity: USP/CGA Oxygen 93. Continuous concentration monitoring with alarm.

C. Air supply: Dedicated oil-free compressors (duplex), with air treatment train — filtration, drying, buffer receivers — upstream of PSA.

D. Reserve: High-pressure cylinder manifold with automatic switchover per NFPA 99 Category 1.

E. Emergency Oxygen Supply Connection (EOSC): Exterior connection per NFPA 99 for emergency supply truck connection.

F. Redundant cross-connection to existing ASEM hospital oxygen system with isolation valves, check valves, and pressure regulation.

G. Source priority sequence (four-tier redundancy per NFPA 99): (1) Primary — PSA generation plant (N+1 generators, on-site continuous supply); (2) Reserve — high-pressure cylinder manifold with automatic switchover; (3) Redundant cross-connection to existing ASEM Central Services Building oxygen system, with isolation valves, check valves, and pressure regulation; (4) Emergency Oxygen Supply Connection (EOSC) on building exterior for emergency supply truck/trailer connection. The control and alarm system shall manage automatic changeover between sources with master alarm annunciation at both master alarm panels and BMS per NFPA 99.

2.02 MEDICAL AIR COMPRESSORS

A. Triplex configuration, oil-free, automatic alternating/sequencing.

B. Air dryers: Desiccant (regenerative) type, duplex — required for low dew point in Puerto Rico's tropical climate.

C. Air purity: CGA G-7.1 Grade E. CO monitor and dew point monitor with alarms.

D. Receiver tank, bacterial/inlet filtration per NFPA 99 Category 1.

2.03 MEDICAL VACUUM

A. Centralized, modular vacuum plant — quadruplex (4 pumps), oil-sealed (oil-recirculating) liquid/rotary vane type.

B. VFD on each pump for capacity modulation. Automatic lead/lag/standby sequencing across four units.

C. Vacuum level: 12–15" Hg below atmospheric at all station outlets.

D. WAGD: Separate dedicated system from medical vacuum. Active WAGD per NFPA 99.

2.04 PIPING

A. Mains and risers: Copper Type K, seamless, ASTM B819 (cleaned for oxygen service).

B. Branch piping to outlets: Copper Type L, seamless, ASTM B819.

C. All joints: Brazed with silver-phosphorus alloy in nitrogen purge. No solder, compression, or push-fit fittings.

D. Color-coded and labeled per NFPA 99 at all outlets, valves, and branches.

2.05 ZONE VALVES

A. Two (2) zone valve assemblies per patient care floor — one per wing (east and west) — per NFPA 99.

B. One (1) dedicated zone valve assembly per Operating Room, located in corridor outside each OR.

C. All zone valves in labeled, locked boxes in corridors with gauges.

2.06 OUTLET STATIONS

A. DISS (Diameter-Index Safety System) per NFPA 99 — gas-specific, non-interchangeable.

B. Minimum outlets per room type:

1. Trauma OR: O_2 (3), VAC (3), MA (2), N_2O (1), N_2 (1), WAGD (1).
2. Trauma ICU Private Room: O_2 (2), VAC (2), MA (1).
3. Trauma Stabilization Cubicle: O_2 (2), VAC (2), MA (1).
4. Minor Procedure Room: O_2 (2), VAC (2), MA (1).
5. Patient Room (Med-Surg, Telemetry, Rehab): O_2 (2), VAC (2) — double station for surge occupancy of two beds per room.

2.07 ALARM SYSTEMS

A. Master Alarm Systems: Two (2) independent master alarm systems, wired on independent circuits, located at two separate 24-hour monitored locations per NFPA 99. Both connected to BMS.

B. Area Alarm Panels: One (1) per floor or zone, at nursing station or zone entrance.

C. Alarms: High/low pressure all gases, vacuum level, source equipment failure, WAGD, PSA concentration, dew point.

PART 3 — EXECUTION

3.01 INSTALLATION

A. Install per NFPA 99. All piping cleaned, purged, and capped per ASTM B819 until connection.

B. No cross-connections between gas systems under any circumstances.

3.02 TESTING AND CERTIFICATION

A. Test per NFPA 99: initial blowdown, standing pressure test, cross-connection test, purity test (O_2 concentration, CO, dew point), flow test at each outlet.

B. All testing witnessed by ASSE 6030-certified verifier. Submit test reports to Owner prior to system activation.

END OF SECTION 22 63 00

HEATING, VENTILATING, AND AIR-CONDITIONING (HVAC) SYSTEMS

SECTION 23 05 00 COMMON WORK RESULTS FOR HVAC

PART 1 — GENERAL

1.01 SUMMARY

A. This Section includes common requirements applicable to all specified HVAC work, including design criteria, codes, submittals, quality assurance, and general execution requirements.

1.02 DESIGN CRITERIA

A. Outdoor Design Conditions (San Juan, PR): 91°F DB / 79°F WB summer; ~80% RH.

B. Indoor Design Conditions: Patient rooms 70–75°F / 30–60% RH. ORs 68–75°F / 20–60% RH per ASHRAE 170.

C. System Type: Constant air volume (CAV) — no VAV. Required for reliable dehumidification in Puerto Rico's tropical humid climate.

D. Chilled water: 38°F supply / 53°F return / 15°F ΔT. Variable primary flow.

E. Surge design basis: All HVAC systems sized for surge occupancy of 182 beds (two beds per room). Cooling load analysis based on surge peak load.

1.02b EQUIPMENT PROPOSALS — OWNER APPROVAL REQUIRED

A. These are performance-based specifications for a Design-Build RFP. No HVAC equipment is pre-specified by manufacturer, brand, or model number for the HVAC systems.

B. The D&B Contractor shall propose all HVAC equipment that meets or exceeds the requirements specified herein and shall submit complete product data to the Owner and Engineer for written approval PRIOR to procurement or installation. No equipment shall be ordered without prior written approval.

C. There are no alternates or substitutions since no base product is specified. All proposed equipment is subject to Owner/Engineer approval based on compliance with these performance specifications.

1.03 REFERENCES

A. ASHRAE 55 — Thermal Environmental Conditions for Human Occupancy.

B. ASHRAE 62.1 — Ventilation for Acceptable Indoor Air Quality.

C. ASHRAE 90.1 — Energy Standard for Buildings.

D. ASHRAE 170 — Ventilation of Health Care Facilities. PRIMARY standard for room-by-room ACH, pressure relationships, filtration.
E. ASHRAE 188 — Legionellosis Risk Management.
F. FGI Guidelines for Design and Construction of Hospitals, latest edition.
G. SMACNA — HVAC Duct Construction Standards, Metal and Flexible.
H. NFPA 90A — Standard for the Installation of Air-Conditioning and Ventilating Systems.
I. NFPA 92 — Standard for Smoke Control Systems.

1.04 SUBMITTALS

A. Mechanical Basis of Design (BOD) Narrative.
B. Computerized Cooling Load Analysis: Room-by-room and block load using Trane TRACE 3D Plus, Carrier HAP, or equivalent. Basis for all equipment sizing.
C. HVAC room-by-room air balance schedule per ASHRAE 170.
D. Equipment product data and performance curves.
E. BMS/DDC control sequences of operation.
F. Acoustic consultant report for chiller room.

1.05 QUALITY ASSURANCE

A. HVAC contractor: Licensed in Puerto Rico, minimum 5 years healthcare HVAC experience.
B. TAB: Independent agency, AABC or NEBB certified. Required for project closeout.
C. Commissioning: Owner's independent Commissioning Agent (CxA) to witness all TAB and functional testing.

END OF SECTION 23 05 00

SECTION 23 05 13 GENERAL REQUIREMENTS FOR HVAC WORK

PART 1 — GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions, Supplementary General Conditions, Special Conditions, and applicable General Requirements Specification sections apply to this Section.

B. All requirements of Section 23 05 00 apply to this Section. This Section incorporates the General Air Conditioning Specifications, adapted and updated to CSI MasterFormat 2020 and project-specific requirements for the Puerto Rico Trauma Hospital.

1.02 DEFINITIONS

A. "Contractor" or "Mechanical Contractor" refers to the D&B Contractor's mechanical subcontractor performing the specified HVAC work.

B. "Engineer" refers to the Mechanical Engineer of Record (PE licensed in Puerto Rico, CIAPR member) responsible for the mechanical design.

C. "Equal" or "Or Equal" means equipment or material that, in the opinion of the Engineer, is equal in quality, durability, appearance, strength, design, and performance to the specified item and will function adequately in the proposed design.

1.03 SUMMARY — SCOPE OF HVAC WORK

A. The HVAC work shall include a complete, tested, and ready-for-operation HVAC system, including: (1) Chilled water plant — three (3) centrifugal chillers 800 ton min. each (2+1), variable primary flow, bypass; (2) Cooling towers — six (6) stainless steel cells Level-2; (3) DOAS — Level-9 Mechanical Room; (4) AHUs — two (2) double-wall per patient floor plus dedicated for ORs/ICU; (5) FCUs — one (1) double-wall 24,000 BTU/hr per patient room; (6) Ductwork, insulation, dampers, grilles, louvers; (7) BMS/DDC with two-way energy valves; (8) Stair pressurization and smoke control; (9) Fire/smoke dampers.

B. All equipment or material shown on drawings and not mentioned in specifications, or vice versa, and all accessories and minor details necessary to complete the work, shall be provided by the Contractor without additional expense to the Owner.

1.04 INTERPRETATION OF DRAWINGS AND SPECIFICATIONS

A. Specifications and drawings are mutually explanatory and complementary. The work shall be performed as called for by both. Any disagreement shall be decided by the Engineer, whose interpretation is final.

B. In cases of disagreement between drawings and specifications, the better quality, greater quantity, or more costly work shall be included in the contract price.

C. Drawings are diagrammatic and indicate the general arrangement of systems. The Contractor shall check drawings of other trades to verify spaces available and maintain maximum headroom. As directed by the Engineer, the Contractor shall make reasonable modifications in layout to prevent conflicts with other trades at no extra charge.

1.05 QUALITY ASSURANCE

A. Submission of an unqualified proposal commits performance of the work as expressed in the drawings and specifications without additional compensation, and commits the Contractor to: (1) abide by all rules and regulations of authorities having jurisdiction; (2) provide every item of work required to complete intended installations; (3) coordinate work with other trades to prevent conflicts.

1.06 REGULATORY REQUIREMENTS

A. The Contractor shall give all necessary notices, obtain permits, and pay all fees and costs in connection with the work. All work shall comply with NFPA 90A, NFPA 92, ASHRAE 170, FGI Guidelines, PRBC, and all referenced standards in Section 23 05 00.

1.07 FIELD MEASUREMENTS

A. The Contractor shall visit the site and base all measurements from established benchmarks. Should the Contractor discover discrepancies that prevent following the intent of the drawings, the Engineer shall be notified before proceeding.

1.08 WARRANTY

A. The Contractor shall, without additional cost, replace all work, material, and/or equipment or any part thereof that develops defects (except from ordinary use) within five (5) years from the date of final approval for equipment under 10 tons, and one (1) year for equipment 10 tons and above.

B. The Contractor shall furnish manufacturer certificates guaranteeing parts and equipment replacement where defects occur due to faulty manufacture for a period of one (1) year from the date of final approval.

1.09 SUBMITTALS

A. Product data, shop drawings, hydraulic and cooling load calculations, BMS submittals, and acoustic consultant report shall be submitted for Engineer review minimum 30 days before fabrication or delivery.

PART 2 — PRODUCTS

2.01 EQUIPMENT — GENERAL

A. All equipment and materials shall be new, first-class quality, and arranged to fit properly into building spaces. Equipment requiring servicing, operation, or maintenance shall be in fully accessible positions. Access doors shall be provided where required.

2.02 EQUIPMENT PROPOSALS AND OWNER APPROVAL

A. No equipment is pre-specified by manufacturer or model in these specifications. These are performance-based specifications for a Design-Build RFP. The Contractor shall propose all HVAC equipment that meets or exceeds the performance, efficiency, acoustic, seismic, code, and material requirements specified herein.

B. The Contractor shall submit complete product data, performance data, shop drawings, and calculations for ALL proposed HVAC equipment to the Owner and Engineer for review and approval PRIOR to procurement, fabrication, or installation. No equipment shall be ordered or installed without prior written approval from the Owner and Engineer.

C. Since no base equipment is specified, there are no alternates or substitutions. All proposed equipment is subject to Owner/Engineer approval based on compliance with these performance specifications.

D. Should any approved equipment subsequently prove defective or unsatisfactory, the Contractor shall replace it with equipment meeting the original performance specifications at no cost to the Owner.

E. Where the proposed equipment requires redesign of structure, partitions, foundations, piping, ductwork layout, or wiring, all such redesign and new drawings shall be prepared by the Contractor at their own expense and approved by the Engineer. All additional ductwork, piping, structural supports, insulation, controls, motors, starters, and electrical wiring required shall be furnished and installed at no additional cost to the Owner.

PART 3 — EXECUTION

3.01 SYSTEM INSTALLATION

A. Installation shall be performed by experienced personnel under supervision of competent foremen per ASHRAE and manufacturer recommendations. The Engineer may stop any work or use of material not being properly installed.

3.02 FOUNDATIONS, SUPPORTS, PIERS, AND ATTACHMENT

A. The Contractor shall furnish and install all foundations, supports, pads, and piers required for HVAC equipment. Concrete pads shall extend 6" beyond machine base in all directions with top edge chamfered. Insert 3" steel dowel rods into floors. Shop drawings for all foundations shall be submitted for Engineer approval before construction. All equipment shall be securely attached to the building structure.

3.03 CUTTING AND PATCHING

A. The Contractor shall provide all cutting and patching necessary to install the work. Patching shall match adjacent surfaces. No structural members shall be cut without approval of the structural engineer.

3.04 ELECTRICAL CONNECTIONS

A. The Contractor shall furnish and install all power wiring from power source to each motor and equipment junction box, including wiring through starters. The Contractor shall install all temperature control wiring for HVAC equipment.

3.05 INTERRUPTION OF EXISTING SERVICES

A. Work requiring interruption of existing services shall be performed at a time that causes the least conflict with ongoing hospital operations. All interruptions shall be coordinated with the General Construction Supervisor and ASEM facilities management. Work shall be performed continuously including after-hours and overtime as required.

3.06 CLEANING AND PROTECTION

A. All piping, ducts, and equipment shall be thoroughly cleaned of foreign substances inside and out before the system is placed in operation. During construction, all open ends shall be protected with temporary covers to prevent entry of foreign elements. The Contractor shall protect all work and material from damage and shall be responsible for all work and equipment until finally inspected, tested, and accepted.

3.07 SCAFFOLDING, RIGGING, AND HOISTING

A. The Contractor shall furnish all scaffolding, rigging, and hoisting services necessary for erection and delivery of equipment. All scaffolding shall be removed from premises when no longer required.

3.08 FIELD QUALITY CONTROL

A. The Contractor shall furnish the services of an experienced superintendent constantly in charge of the installation, together with all skilled workmen required to erect, connect, adjust, start, operate, and test each system. The Engineer may stop any work not being properly installed.

3.09 COORDINATION WITH OTHER TRADES

A. The Contractor shall give full cooperation to other trades, furnish information in writing as needed, and coordinate all HVAC work with architectural, structural, electrical, plumbing, fire protection, and medical gas trades. Submit coordination drawings in BIM (Revit preferred).

3.10 QUIET OPERATION AND VIBRATION CONTROL

A. All work shall operate without sound or vibration objectionable to the Engineer. Conditions considered objectionable shall be corrected at the Contractor's expense. Particular attention shall be given to preventing noise and vibration transmission from the Main Chiller Room (below the Operating Rooms) to adjacent areas per Section 23 64 00 acoustic requirements.

B. Vibration isolation devices shall include: (1) inertia-base spring isolators for all equipment; (2) sound absorber pads; (3) vibration isolators for weather-exposed equipment equipped with limit stops per ASCE 7/PRBC wind loads; (4) steel parts (except springs) galvanized; springs cadmium plated. All vibration isolation systems shall be installed per manufacturer's instructions.

3.11 PAINTING

A. All outdoor equipment, hangers, and other metallic surfaces (except aluminum and stainless steel) shall be wire-brushed, cleaned, and painted with two (2) coats of anticorrosion primer. All interior metallic surfaces (except aluminum and stainless steel) shall receive one (1) coat of anticorrosion primer. Final color as indicated by the Architect.

3.12 TESTS

A. All piping, ductwork, and equipment shall be tested as specified. Labor, material, instruments, and power required for testing shall be furnished by the Contractor. Tests shall be performed in the presence of the Engineer and other parties having legal jurisdiction. All defective work shall be repaired and tests repeated until approved.

3.13 WATERPROOFING

A. Where work passes through waterproofing, the method of installation shall be approved by the Engineer before work is done. The Contractor shall furnish all caulking and flashing to make openings absolutely watertight — especially critical for all exterior louver penetrations in Puerto Rico's hurricane-exposed environment.

3.14 TESTING AND BALANCING (TAB)

A. TAB shall be performed by an independent AABC or NEBB certified agency. Work shall include: (1) obtain required air quantities at all operating conditions confirming constant-volume delivery; (2) verify pressure relationships in all ORs, isolation rooms, and critical care spaces per ASHRAE 170; (3) balance all chilled water and condenser water systems and verify two-way energy valve ΔT (15°F); (4) verify DOAS performance — leaving dew point, energy recovery effectiveness, and constant airflow; (5) verify stair pressurization (0.05–0.35 in. w.c.) and smoke control sequences per NFPA 92. TAB is a required condition of project closeout.

3.15 IDENTIFICATION

A. All equipment shall be tagged with nameplates showing equipment tag number, service, capacity, and electrical characteristics. All piping shall be labeled per ASME A13.1 indicating service and flow direction. All ductwork shall be labeled at each floor level indicating service and system designation.

3.16 OPERATION AND MAINTENANCE MANUALS

A. O&M manuals shall include: manufacturer's installation/operation/maintenance instructions; equipment schedules with final as-installed capacities; BMS/DDC as-built control sequences; recommended maintenance schedules; emergency shutdown/restart procedures; and spare parts list for minimum one (1) year of operation. Provide minimum eight (8) hours of Owner staff training per major system (chillers, DOAS, BMS) before final acceptance.

END OF SECTION 23 05 13

SECTION 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 — GENERAL

1.01 SUMMARY

A. Provide complete Building Management System (BMS) with Direct Digital Controllers (DDC) for all HVAC systems, fully centralized in a computer-based system (head-end server with operator workstation).

B. Network protocol: BACnet/IP open protocol. All DDC controllers report to central computer.

PART 2 — PRODUCTS

2.01 TWO-WAY ENERGY VALVES

A. All chilled water coils (AHUs, fan coils, DOAS) shall be controlled by two-way energy valves (pressure-independent characterized control valves with integral flow measurement and energy/ΔT monitoring).

B. Valves shall maintain design ΔT (15°F), eliminate low-ΔT syndrome, automatically balance flow, and report real-time flow, supply/return temperature, energy consumption, and valve position to BMS.

2.02 BMS MONITORING POINTS

A. HVAC: Supply airflow and duct static pressure; return/supply air temperature; zone temperature and humidity; CO_2 levels; AHU filter differential pressure; chiller plant sequencing; DOAS leaving air temperature/dew point; two-way energy valve flow and ΔT; fan VFD speed; OR room pressure (continuous with door indicators); fire/smoke damper position.

B. Plumbing: Potable cistern level (high/low alarms); booster pump status; pressure in both risers; HWR temperatures by zone; chlorination system status.

C. Medical Gases: Master alarm system — source equipment status, main line pressures, all gas/vacuum conditions — reported to BMS supplementary to dedicated NFPA 99 panels.

END OF SECTION 23 09 00

SECTION 23 23 00 REFRIGERANT PIPING

PART 1 — GENERAL

1.01 SUMMARY

A. Provide condenser water piping between chiller condensers and cooling towers, and chilled water distribution piping, per this Section.

PART 2 — PRODUCTS

2.01 CHILLED WATER PIPING INSULATION — PIPE INSULATION SCHEDULE

All chilled water and reheat water piping shall be insulated per the following schedule. All materials: FSI ≤25 / SDI ≤50 per ASTM E84, NFPA 90B.

Service	Min Dia.	Max Dia.	Thickness	K / R Value	Material	Outdoor Finish	Indoor Concealed	Indoor Exposed
CHW 40–60F	1/2"	1"	**1-1/2"**	K=0.19 @50F R-7.9 (2-1/2"+: R-10.5)	PIR with Integral VR (Perm≤0.05)	VR Jacket + 6oz Canvas + MON ECO Mastic + 0.016" Alum. Jacket	VR Jacket + MON ECO Mastic White	VR Jacket + MON ECO + Zeston PVC 30 MLS White. FS≤25/SD≤50

	2-1/2"	8"	**2"**					

END OF SECTION 23 23 00

SECTION 23 64 00 PACKAGED WATER CHILLERS AND COOLING TOWERS

PART 1 — GENERAL

1.01 SUMMARY

A. Provide three (3) factory-assembled, charged, and run-tested water-cooled centrifugal chillers configured 2 duty + 1 standby (2+1/N+1), in the Basement Main Chiller Room (sound-isolated per Section 23 64 00 Part 2.05). Also provide six (6) induced-draft cooling tower cells in the Level-2 Mechanical Roof Yard. All equipment shall be factory-assembled and ready for field installation.

B. Units shall produce the specified tonnage per the scheduled data in accordance with AHRI 550/590 (current edition). Units shall bear the AHRI certification label as applicable.

1.02 REFERENCES

A. AHRI 550/590 — Performance Rating of Water-Chilling and Heat Pump Water-Heating Packages Using the Vapor Compression Cycle (current edition).

B. AHRI 575 — Method of Measuring Machinery Sound Within an Equipment Space.

C. ASHRAE 15 — Safety Standard for Refrigeration Systems (current edition).

D. ASHRAE 90.1 — Energy Standard for Buildings (current edition) — minimum efficiency compliance.

E. ASME Section VIII — Boiler and Pressure Vessel Code (pressure vessel construction).

F. ANSI/UL 465 — Central Cooling Air Conditioners.

G. ARI Standard 365 — Commercial and Industrial Unitary Air-Conditioning Condensing Units.

H. Puerto Rico Building Code (PRBC) — seismic and wind load requirements.

I. ASCE 7 — Minimum Design Loads for Buildings and Other Structures.

1.03 QUALITY ASSURANCE

A. Manufacturer Qualifications: Firms regularly engaged in manufacture of water-cooled centrifugal chillers and cooling towers, with products in satisfactory use in similar service for not less than ten (10) years.

B. Installer Qualifications: Firm with at least five (5) years of successful installation experience on projects with chiller plant systems similar to that required for this project.

C. No equipment is pre-specified by manufacturer or model. These are performance-based specifications. Equipment from any qualified manufacturer meeting all requirements specified herein is acceptable. The Contractor shall propose equipment and obtain written Owner/Engineer approval prior to procurement.

D. No alternates or substitutions apply since no base equipment is specified. All proposed equipment is subject to Owner/Engineer approval based on compliance with these specifications.

1.04 SUBMITTALS AND OWNER APPROVAL

A. The Contractor shall submit the following for Owner and Engineer review and approval PRIOR to procurement or installation of any chiller or cooling tower equipment:

B. Product Data: Manufacturer's technical data with contractor's name, project name, and installation instructions for each piece of equipment. Generic data will not be accepted. Submittals shall clearly indicate specific service, section, and article number of specifications governing.

B. Performance Data: Submit factory performance test report indicating energy input versus cooling output from 100% full load to minimum stable load, using constant entering condenser water temperature. Test per AHRI 550/590 at a certified test facility. The factory test instrumentation calibration shall be traceable to NIST. Certified test report signed by an officer of the manufacturer's company is required; pre-printed certification is not acceptable.

C. Sound Data: Submit Sound Pressure Level (SPL) in decibels (dB), referenced at 20 micropascals, rated per AHRI 575. Ratings shall represent the loudest operating condition. Reducing entering condenser water temperature or raising leaving chilled water temperature to obtain better sound ratings is not permitted.

D. Shop Drawings: Scaled drawings showing dimensioned layouts, equipment footprint, elevations, relation to space enclosure, required service and access clearances, pipe sizes and locations, and wall/floor penetrations.

E. Record Drawings: At project closeout, submit record drawings of installed equipment, accessories, and connections.

F. Rigging, installation, and start-up procedures; O&M manuals, parts lists, and troubleshooting guides.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Chillers shall be delivered to the job site completely assembled and fully charged with refrigerant and oil. Maintain the manufacturer’s original packing and crating until the unit is on-site and ready for permanent installation.

B. Where possible, store equipment inside protected from weather in the original packing and crating. When necessary to store outside, store above grade and enclose with waterproof wrapping.

C. Prior to installation, the Contractor shall verify with the Engineer that all equipment is in good condition and all accessories are intact. Do not accept damaged units; report any damage to the equipment manufacturer immediately.

1.06 WARRANTY

A. The Contractor shall leave the entire chiller and cooling tower installation in proper working condition and shall, without additional cost, replace any work, material, and/or equipment or any part thereof that develops defects (except from ordinary use) within five (5) years from the date of final approval issued by the Engineer.

B. Chiller manufacturer shall provide complete unit parts warranty (excluding refrigerant) for one (1) year from the date of final approval.

C. The Contractor shall be responsible for all damages resulting from defective material and/or equipment and shall repair or replace all injuries to existing work caused by such defects without additional charges to the Owner.

D. The Contractor shall furnish manufacturer certificates or guarantees to furnish new parts, materials, or equipment where defects occur due to faulty manufacture for a period of one (1) year from the date of final approval.

1.07 MAINTENANCE — FIRST YEAR

A. The chiller manufacturer shall provide, as part of the contract, the first-year oil and filter change for each chiller.

B. The chiller manufacturer shall provide an annual inspection of gears and all bearings (where applicable) for the first five (5) years, with a written report forwarded to the Owner each year confirming completion.

C. The chiller manufacturer shall provide first-year purge unit maintenance as applicable.

PART 2 — PRODUCTS

2.01 WATER-COOLED CENTRIFUGAL CHILLERS

A. General: Factory-assembled, weather-proofed, internally control-wired, fully charged with refrigerant. Quantity: Three (3). Configuration: 2 duty + 1 standby (N+1/2+1).

B. Capacity: Each unit minimum 800 tons refrigeration at the following design conditions:

1. Chilled Water: 38°F leaving evaporator / 53°F entering evaporator. Design ΔT = 15°F.
2. Condenser Water: 85°F entering / 97°F leaving at 2.3 GPM/ton.
3. Firm plant capacity (2 units operating): 1,600 tons minimum.

C. Efficiency: Minimum 0.56 kW/ton (full load) or better per ASHRAE 90.1 at the design conditions. Submit AHRI-certified performance data. Comply with ASHRAE 90.1 at both full load and part load (IPLV) conditions.

D. Compressor: Fully hermetic, high-efficiency centrifugal compressor. Impeller shall be statically and dynamically balanced. Compressor vibration shall not exceed 0.15 inches per second. Unit shall have an independent refrigeration circuit with easily accessible service ports and factory-installed filter drier.

E. Refrigerant: Low-GWP refrigerant compliant with the Montreal Protocol, AIM Act, and all applicable EPA regulations at the time of procurement. HFO blends or HFCs with GWP below 700 are preferred. No refrigerants containing HCFC-123 shall be used. Coordinate refrigerant selection with Owner prior to final equipment selection.

F. Controls: Factory-mounted DDC controller with BACnet/IP interface to the building BMS. All unit wiring shall be color-coded. Factory-wired terminal block with pressure lugs for power wiring.

G. Performance Testing: Each chiller shall be factory performance-tested at an AHRI-certified test facility. The owner or his representative shall be notified at least ten (10) days in advance to witness the test. A certified test report signed by a company officer shall be submitted

prior to project completion. Performance penalties per AHRI 550/590 tolerances shall apply if units fail to meet submitted performance. Equipment manufacturer shall not invoice for chillers until successful completion of performance test with acceptance or penalty deduction.

2.02 CHILLED WATER PUMPS

A. Type: Vertical inline centrifugal, variable primary flow (primary-only). One pump per chiller — three (3) total (2 duty + 1 standby).

B. VFD on each pump. Automatic lead-lag-standby sequencing interlocked with chillers.

C. Required bypass: Chilled water bypass pipe with modulating control valve across supply and return headers at chiller plant. Fail-open on loss of control signal. BMS-controlled based on primary loop flow vs. minimum chiller flow setpoint.

2.03 COOLING TOWERS

A. General: Factory-assembled and tested, induced-draft, vertical air discharge. Quantity: Six (6) cells — 4 duty + 2 backup — located in Level-2 Mechanical Roof Yard. Each unit shall process minimum 3,000 GPM at 95°F entering / 85°F leaving (condenser water design conditions).

B. Construction — Casing: Principal structural panels, elements, basin, and fan deck shall be constructed of stainless steel Type 304. All nuts, bolts, and fasteners shall be stainless steel Type 304. The support structure shall be protected with a factory-applied corrosion-resistant coating system (equal to or exceeding SSPC SP6 surface prep + epoxy primer + polyurethane topcoat) or shall be fabricated from stainless steel. No galvanized steel frames.

C. Basin: Cold water basin shall be stainless steel Type 304, sized and sloped for complete drainage. Basin shall include anti-sedimentation screens and low-water level protection.

D. Inlet Louvers: Wave-form fiberglass-reinforced polyester (FRP) or equivalent non-corrosive material. Louvers shall minimize water splash-out.

E. Fan Motors: VFD-ready, with permanently lubricated bearings and moisture protection (IP55 minimum enclosure). One VFD per cell for condenser water temperature control and energy savings.

F. Drift Eliminators: Limit drift losses to 0.005% or less of the design circulating water flow rate. Multi-pass chevron or cellular design.

G. Noise Attenuation: Low-noise fan blades and/or discharge/intake sound attenuators. Acoustic calculations required given proximity to patient care floors. Maximum sound level at the property line per local noise ordinance.

H. Seismic and Wind: Comply with seismic and wind requirements for Puerto Rico per PRBC 2018 Amendment and ASCE 7. Spring/neoprene vibration isolators with seismic snubbers under each cell. All condenser water piping crossing seismic isolation planes shall have flexible connectors.

2.04 INSPECTION — SITE CONDITIONS

A. The Contractor shall carefully examine the site and conditions under which the chillers and cooling towers will be installed. Familiarize with existing conditions, character, extent, quality, and quantity of work to be performed and materials to be furnished. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer. Filing of a proposal shall be presumptive evidence that the Contractor has complied with these requirements; later claims for labor, equipment, or materials required due to difficulties that could have been foreseen will not be recognized.

2.05 CHILLER ROOM ACOUSTIC AND VIBRATION ISOLATION

A. The Main Chiller Room is directly below the Trauma Surgery Department and Operating Rooms on the Ground Level. The following acoustic and vibration isolation measures are required:

1. Room Enclosure: Walls, floor slab, and ceiling (underside of Ground Level slab) shall be constructed with sound-rated assemblies — minimum STC 60 — including mass-loaded assemblies, resilient layers, and/or floating floor construction as determined by the acoustic consultant.
2. Equipment Isolators: Inertia-base spring vibration isolators on all chillers, pumps, cooling tower fans, and rotating equipment. Sized for each piece of equipment to attenuate vibration transmission to the building structure.
3. Piping: Flexible vibration-isolation connectors at all chilled water and condenser water equipment connections.
4. Doors: Acoustically rated minimum STC 50, gasketed, and self-closing.
5. Ducts: Silencers on all ducts penetrating chiller room boundaries.
6. Acoustic Consultant Report: Required at Design Development phase confirming NC-20 to NC-25 in ORs above. Report shall be submitted to Owner for review.

PART 3 — EXECUTION

3.01 EQUIPMENT INSTALLATION

A. All equipment shall be set in place, leveled to within 1/8 inch across the entire dimension of the unit in all directions, and connected as indicated on the drawings. All equipment shall be properly protected from damage during construction and thoroughly cleaned; factory-applied paint shall be touched up where scratched or otherwise damaged prior to final acceptance.

B. Roof-level cooling tower installations shall be set on structural bases with vibration isolators per the approved shop drawings and structural engineer's design. Locate units to maintain the minimum service and airflow clearances recommended by the manufacturer.

C. Installation procedures shall be in strict accordance with the manufacturer's published instructions and contract documents herein before specified.

3.02 FIELD QUALITY CONTROL

A. Performance Test: Run-test each chiller and cooling tower cell and check for proper rotation, refrigerant pressures, proper chilled water and condenser water temperatures, excessive noise or vibration, and rated flow. Repair or replace any parts found defective.

B. Witness Testing: All field performance tests shall be witnessed by the Owner's Commissioning Agent (CxA). The Contractor shall provide advance notice of all test schedules.

3.03 EQUIPMENT CONNECTIONS

A. See hydronic piping specifications (Section 23 23 00) for all chilled water and condenser water piping connections, insulation, and testing requirements.

B. Electrical connections in accordance with applicable electrical specifications; equipment wiring diagrams to be submitted with shop drawings.

3.04 DEMONSTRATION AND TRAINING

A. Train Owner's representatives in procedures and schedules related to start-up, shutdown, troubleshooting, servicing, and preventive maintenance of the chiller plant and cooling towers. Minimum eight (8) hours of training. Schedule training through the Owner's representative prior to final acceptance.

3.05 TESTING AND BALANCING

A. Refer to Section 23 05 00 and Section 23 05 13 for Testing, Adjusting, and Balancing requirements for all chilled water and condenser water systems.

END OF SECTION 23 64 00

SECTION 23 74 00 PACKAGED OUTDOOR HVAC EQUIPMENT — DOAS AND AHUs

PART 1 — GENERAL

1.01 SUMMARY

A. Provide Dedicated Outdoor Air System (DOAS) units and Air Handling Units (AHUs) for the facility. All systems shall be constant air volume (CAV) — no VAV — to ensure reliable dehumidification in Puerto Rico's tropical climate.

PART 2 — PRODUCTS

2.01 DEDICATED OUTDOOR AIR SYSTEM (DOAS)

A. Location: Ninth Level Mechanical Room, directly below heliport.

B. Configuration: Dedicated units treating 100% outdoor air — filter, cool, dehumidify, and reheat before delivery to AHUs and FCUs. N+1 for critical care areas.

C. Dehumidification: Target leaving dew point 50–55°F to manage entire building latent load.

D. Energy Recovery: Total energy recovery (enthalpy wheel or membrane), minimum 60% effectiveness. No cross-contamination with isolation/contaminated exhaust streams.

E. Patient Room Bathroom Exhaust Integration: Bathroom exhaust ducted to DOAS energy recovery device. Sensible/total recovery — plate or membrane type (no wheel for toilet exhaust). Bathroom exhaust ducts serving DOAS to be insulated.

F. Outdoor air intakes: Positioned away from heliport downwash, generator exhaust, cooling tower discharge, and vent terminals per ASHRAE 170/FGI separation requirements. Bird/insect screens at all intakes.

2.02 AIR HANDLING UNITS (AHUs)

A. Patient care floors: Two (2) AHUs per floor (common areas), fed by independent chilled water risers (Riser 1 to AHU-A, Riser 2 to AHU-B).

B. ORs, ICU, isolation, procedure rooms: Independent dedicated AHUs — not the patient-room arrangement.

C. Construction: Double-wall casing with insulation encapsulated between inner and outer metal liners.

D. Components: MERV-14 minimum filtration (HEPA for ORs and isolation rooms); chilled water coil with two-way energy valve; electric reheat coil (dehumidification only — no space heating required in PR); supply/return fans with VFDs; stainless steel drain pan with deep-seal trap; insulated condensate drain.

E. Surgical AHUs: UV-C germicidal irradiation (UVGI) downstream of cooling coil and over drain pan. Access doors interlocked to de-energize lamps. Run-time monitoring via BMS.

F. Chilled water coil ΔT: 15°F (38°F EWT / 53°F LWT) at design conditions. Constant volume operation — temperature controlled by two-way energy valve.

2.03 FAN COIL UNITS (FCUs)

A. Quantity: One (1) FCU per patient room, plus perimeter zones, offices, and support spaces as required.

B. Capacity: Minimum 24,000 BTU/hr per patient room (surge occupancy: two beds per room).

C. Construction: Double-wall casing. Type: Concealed ceiling or vertical, chilled water with VFD/ECM motor.

D. Control: Two-way energy valve on chilled water coil, individual room thermostat via DDC/BMS.

E. Condensate: Stainless steel drain pan; condensate drain insulated with vapor barrier; overflow protection.

F. Filtration: MERV-8 at return; MERV-14 ventilation air from DOAS.

G. All FCU ventilation air from DOAS — no direct outdoor air intake at individual FCUs.

END OF SECTION 23 74 00

SECTION 23 31 00 HVAC DUCTS AND CASINGS

PART 1 — GENERAL

1.01 SUMMARY

A. Provide complete ductwork systems for supply, return, exhaust, and outdoor air distribution per SMACNA HVAC Duct Construction Standards and ASHRAE 170.

PART 2 — PRODUCTS

2.01 DUCTWORK

A. Material: Galvanized steel per SMACNA. Minimum 26-gauge for low-pressure systems.

B. Velocity: Maximum 1,500 FPM mains; 1,000 FPM branches in clinical spaces.

C. Static pressure design: 0.08" WG per 100 LF — supply and return ductwork. 0.015" WG per 100 LF — exhaust ductwork.

2.02 DUCTWORK INSULATION SCHEDULE

All ductwork shall be insulated per the following schedule:

Location	Duct Type	K Value	R Value	Density	Thickness	Material Type	NFPA Grade
Interior Concealed	Supply/Return/Exhaust	0.25 BTU-IN/HR @75° F	R-6	1.5 LB/FT^3	1-1/2"	Flexible Fiberglass with FSK Vapor Barrier	—
Interior Exposed	Supply/Return/Exhaust	0.25 BTU-IN/HR @75° F	R-8	1.5 LB/FT^3	2"	Rigid Fiberglass with FSK Vapor Barrier	FS C25 / Smoke C50 per ASTM E84
Exterior	Supply	0.25 BTU-IN/HR	R-10	6 LB/FT^3	2"	Rigid Polyisocyanurate with Canvas, Mastic, Painted	—

Location	Duct Type	K Value	R Value	Density	Thickness	Material Type	NFPA Grade
		@75° F				White, Aluminum (0.16) Cover	

2.03 FIRE/SMOKE DAMPERS

A. Combination fire/smoke dampers (FSD), UL 555/555S listed, at all duct penetrations of fire-rated floor or shaft enclosures — outdoor air and exhaust ducts traversing vertical chases from Floor 1 through Floor 10.

B. Electric actuators with end-switch position indication reported to fire alarm panel and BMS.

C. Access doors at every FSD for inspection, testing, and reset per NFPA 80/105.

2.04 AIR DISTRIBUTION GRILLES AND LOUVERS

A. All supply, return, and exhaust grilles/registers: Aluminum construction with opposed-blade dampers (OBD). Smooth cleanable surface in clinical areas.

B. Exterior louvers: Aluminum, drainable-blade type, hurricane-resistant. Tested per ASTM E1233 or equivalent for water penetration resistance at design wind speed per ASCE 7/PRBC. Bird/insect screens at all outdoor air intakes.

PART 3 — EXECUTION

3.01 INSTALLATION

A. Install per SMACNA. All duct penetrations of fire-rated assemblies with approved fire-stopping.

B. Duct leakage class per SMACNA. Pressure test all systems serving critical care areas prior to ceiling close-out.

C. All OR and isolation room supply air through ceiling diffusers designed for laminar or non-aspirating flow per FGI and ASHRAE 170.

3.02 STAIR PRESSURIZATION AND SMOKE CONTROL

A. Both stairwells mechanically pressurized per NFPA 92: maintain 0.05–0.35 in. w.c. positive pressure relative to adjacent floors with stair doors closed.

B. Barometric relief dampers or VFD fan modulation to limit door-opening force to maximum 30 lbf per NFPA 101.

C. Stair pressurization fans on essential power; auto-start on general fire alarm; status and alarms to fire alarm system and BMS.

D. HVAC systems interlocked with fire alarm for smoke control sequence per NFPA 90A and NFPA 92.

3.03 TESTING AND COMMISSIONING

A. TAB: Complete Test, Adjust, and Balance by independent AABC or NEBB certified agency. All supply, return, exhaust, and outdoor air quantities measured room-by-room.

B. Critical space verification: ACH and pressure relationships in all ORs, AII isolation rooms, and critical care spaces certified per ASHRAE 170. Documented at each room.

C. DOAS performance verification: Leaving dew point, energy recovery effectiveness, constant volume delivery.

D. Functional testing: Chillers, cooling towers, pumps (VPF and bypass), DOAS, AHUs, FCUs, BMS sequences, fire/smoke dampers, stair pressurization, alarms.

E. All testing witnessed by Owner's Commissioning Agent (CxA). Deficiencies corrected and re-tested before Owner acceptance.

F. Closeout documentation: Final TAB report, commissioning report, as-built drawings, O&M manuals, equipment warranties, and minimum 8 hours Owner staff training per system.

END OF SECTION 23 31 00

END OF MECHANICAL SPECIFICATIONS

MECHANICAL SYSTEMS

These specifications are performance-based for a Design & Build RFP. The Design-Build Entity shall engage a Professional Engineer licensed in Puerto Rico and a CIAPR member as Engineer of Record. All drawings and specifications produced by the Design-Build Entity shall be signed and sealed by the Puerto Rico PE prior to submission for permits.

Attachment C: Bridging Documents - Report

PUERTO RICO TRAUMA HOSPITAL

PREPARED FOR

Administración de Servicios Médicos de Puerto Rico (A.S.E.M.)

Puerto Rico Medical Center | San Juan, Puerto Rico

August 13, 2026

FINAL REPORT

Bridging Documents for the New Puerto Rico Trauma Hospital

DE LA TORRE – ESTÉVEZ
ARCHITECTS - PLANNERS

NOTICE OF DOCUMENT USE

A. PROPRIETARY RIGHTS, LIMITED AUTHORIZATION, AND RESTRICTIONS ON USE OF BRIDGING DOCUMENTS

These drawings, specifications, narratives, criteria, reports, calculations, schedules, details, and other materials comprising the Bridging Documents have been prepared exclusively to establish the Owner's programmatic requirements, functional and operational objectives, design intent, performance requirements, minimum quality standards, and technical basis of design for the Request for Proposals and Design-Build procurement process for the Puerto Rico Trauma Hospital Project.

Except as otherwise expressly provided in the applicable Professional Services Agreement, these Bridging Documents constitute instruments of professional service prepared by De La Torre–Estévez Architects and shall remain subject to all applicable proprietary, copyright, intellectual-property, and professional-use protections. No ownership interest, copyright, or unrestricted right of use is transferred by the issuance, distribution, reproduction, or authorized use of these documents.

Subject to the prior written consent of De La Torre–Estévez Architects and the terms and conditions established by the Owner, the Medical Services Administration of Puerto Rico ("ASEM"), a limited, nonexclusive, and nontransferable authorization is granted solely to ASEM and to those Design-Build entities formally authorized by ASEM to participate in the procurement process. Such authorization is limited exclusively to reviewing, evaluating, interpreting, and using the Bridging Documents for the preparation and submission of proposals and, following award, as reference design guidance for the development of the Project's final design and construction documents.

These Bridging Documents are not final design documents, permit documents, bid documents for conventional construction procurement, fabrication documents, shop drawings, or construction documents. They shall not be used, in whole or in part, for permitting, fabrication, ordering or procurement of construction materials or systems, installation, construction, or any other purpose unrelated to the authorized Design-Build procurement process. Direct use of these documents for construction is expressly prohibited.

The selected Design-Build entity, acting through its duly licensed Architect of Record, Engineer(s) of Record, specialty consultants, delegated-design professionals, contractors, subcontractors, manufacturers, and suppliers, as applicable, shall be solely responsible for developing, completing, coordinating, reviewing, and certifying all final architectural, engineering, permitting, procurement, fabrication, and construction documents required for the proper execution and completion of the Project.

The Design-Build entity shall independently investigate and verify all existing conditions, field dimensions, elevations, quantities, utility locations, site constraints, design assumptions, technical criteria, code requirements, and other information affecting the Work. Information contained in the Bridging Documents shall not relieve the Design-Build entity or its design

professionals from their independent professional judgment, due diligence, coordination obligations, or responsibility for the accuracy, completeness, constructability, code compliance, permitting, safety, and performance of the final design and completed Work.

No representation or warranty is made that the Bridging Documents are complete or suitable for direct construction use. Any unauthorized use, reproduction, modification, adaptation, distribution, disclosure, or reliance upon these documents shall be at the sole risk of the person or entity undertaking such use and without liability to De La Torre–Estévez Architects or its consultants. No third-party rights, licenses, or benefits are created by the preparation, issuance, or authorized distribution of these documents.

B. PROJECT DESIGN NARRATIVES — PURPOSE, SCOPE, OWNER CONFIRMATION, AND DESIGN-BUILD ENTITY RESPONSIBILITIES

The architectural, structural, electrical, and mechanical narratives included in these Bridging Documents describe the recommended design concepts, systems, services, performance criteria, functional relationships, technical assumptions, and anticipated scope requirements established for the Puerto Rico Trauma Hospital at the current Advanced Architectural Design Development stage. These narratives are intended to communicate the Owner's programmatic objectives, operational requirements, design intent, basis-of-design concepts, minimum performance expectations, and preliminary technical direction for use in the Request for Proposals and subsequent Design-Build process.

The Advanced Architectural Design Development and the related architectural, structural, electrical, and mechanical narratives were developed under the direction of De La Torre-Estevez Architects, as Bridging Architect, based upon the firm's professional architectural judgment and experience in healthcare planning and design, together with the professional input of the applicable engineering disciplines. They also reflect the programming, planning, clinical, operational, functional, and service requirements developed, coordinated, and agreed upon with the Medical Services Administration of Puerto Rico (ASEM). This process culminated in the Schematic Design reviewed and approved by ASEM as the basis for further development of the Project.

ASEM's review and approval of the Schematic Design confirm the programmatic basis, planning criteria, service requirements, and general design direction represented at that stage. Such review and approval do not convert the Schematic Design, the Advanced Architectural Design Development, or any other Bridging Document into a final design, permit document, construction document, or certification of complete code compliance, and do not relieve the Design-Build Entity or its design professionals of their independent professional duties and responsibilities.

The Advanced Architectural Design Development was prepared with consideration of the codes, standards, regulations, and healthcare design guidelines identified as applicable to the Project and reasonably required for the scope and level of completion represented by this Bridging Documents stage. Any code analysis, design criteria evaluation, system development,

preliminary sizing, interdisciplinary coordination, or compliance review performed for the Bridging Documents is limited to, and commensurate with, the information developed at this stage. It shall not be interpreted as a final code analysis, final engineering verification, final system design, or representation that the permit documents, construction documents, or completed Work have been fully developed or verified for compliance with every applicable requirement.

The narratives shall be read together with the Advanced Architectural Design Development Drawings, preliminary technical specifications, programmatic information, reports, surveys, studies, criteria, and other Bridging Documents issued by or on behalf of ASEM. The narratives are complementary to, and shall not be interpreted independently from, the remaining Bridging Documents. Any Owner-directed revision to the approved program, scope, layouts, system concepts, performance criteria, or service requirements shall be documented and confirmed in writing by ASEM, and the Design-Build Entity shall evaluate and incorporate the resulting design, cost, schedule, permitting, coordination, and construction impacts.

The narratives are not intended to constitute complete final designs, final engineering calculations, final system selections, final construction documents, or a complete statement of every component, service, connection, control, accessory, or requirement necessary for construction and operation of the Project. Their purpose is to establish the recommended technical and design basis from which the Design-Build Entity shall independently develop the complete Project design.

Upon proceeding with the Project beyond the Bridging Documents stage, the Design-Build Entity shall be solely responsible, through its duly licensed Architect and Engineers of Record and other qualified design professionals, for independently reviewing, verifying, validating, coordinating, supplementing, refining, and completing the concepts, systems, and requirements described in the narratives and other Bridging Documents. The Design-Build Entity shall identify and apply all codes, standards, regulations, authority requirements, healthcare guidelines, amendments, and official interpretations applicable to the final design, permitting, construction, occupancy, and operation of the Project, including those in effect or made applicable after issuance of the Bridging Documents.

The Design-Build Entity's use, adoption, modification, or further development of any concept, layout, system, criterion, assumption, or recommendation contained in the Bridging Documents shall be based upon its own independent professional review and shall constitute its acceptance of professional responsibility for incorporating that information into the final Project design. The Design-Build Entity shall prepare, sign and seal as required, and assume full professional responsibility for all analyses, calculations, studies, drawings, specifications, schedules, diagrams, models, reports, permit documents, construction documents, and other design deliverables necessary to provide a complete, coordinated, code-compliant, permit-ready, construction-ready, operational, and maintainable facility.

Unless separately retained under a subsequent written professional services agreement, De La Torre-Estevez Architects shall not serve as the Architect of Record, Engineer of Record, delegated designer, or design professional responsible for the Design-Build Entity's final

design, permit documents, construction documents, means and methods, construction, or completed Work. Nothing in the Bridging Documents shall be interpreted as transferring to the Bridging Architect responsibility for professional services, design decisions, documents, certifications, or construction activities undertaken by or on behalf of the Design-Build Entity after commencement of its design development services.

1. OWNER CONFIRMATION OF NARRATIVE RECOMMENDATIONS

Before advancing the final design of each discipline, the Design-Build Entity shall review the corresponding narrative recommendations with ASEM and obtain confirmation of the Owner's current programmatic, operational, technical, infrastructure, maintenance, phasing, and institutional requirements.

This confirmation process is particularly important where ASEM may be considering modifications to the preliminary recommendations, design criteria, system concepts, operational relationships, utility arrangements, departmental layouts, construction phasing, or other Project requirements that could materially affect the final design or construction documents.

The Design-Build Entity shall not assume that all preliminary recommendations remain unchanged solely because they are included in the Bridging Documents. At the beginning of the Design-Build design phase, and at each required design review milestone, the Design-Build Entity shall identify and document:

a. Narrative recommendations that have been confirmed by ASEM.
b. Narrative recommendations that require additional evaluation or clarification.
c. Owner-requested modifications or refinements.
d. Proposed Design-Build Entity alternatives or improvements.
e. Potential effects on cost, schedule, phasing, permitting, utility capacity, maintainability, hospital operations, resiliency, and future expansion.
f. Decisions required from ASEM to allow the design to proceed in a timely and coordinated manner.

ASEM's review, consultation, confirmation, comments, or acceptance of design concepts shall not relieve the Design-Build Entity or its Architect and Engineers of Record from responsibility for the completeness, accuracy, code compliance, technical adequacy, coordination, constructability, safety, performance, and professional standard of care applicable to the final design and construction documents.

2. ELECTRICAL SERVICE AND POWER-DISTRIBUTION CONCEPTS

The electrical narrative recommendations—including the proposed primary electrical point of connection, connection location, utility-service voltage, routing of primary and secondary electrical feeders to the Hospital Building, building substation configuration, transformer capacities and voltages, normal-power distribution, emergency-power distribution, and proposed emergency-generator-bank concept—shall be verified and confirmed by the Design-Build Entity in consultation with ASEM and the applicable utility and regulatory authorities.

The Design-Build Entity shall confirm, at a minimum:

a. The final location, ownership, configuration, capacity, voltage, and technical requirements of the primary electrical point of connection.
b. The availability, adequacy, reliability, and routing of the proposed electrical service from the utility or ASEM campus infrastructure to the Hospital Building.
c. The proposed exterior 38 kV substation concept and its coordination with the existing ASEM electrical infrastructure.
d. The required primary and secondary distribution voltages.
e. The capacity, arrangement, redundancy, protection, metering, and physical location of transformers, switchgear, substations, feeders, distribution equipment, and associated electrical rooms.
f. The proposed normal, essential, emergency, life-safety, critical, and equipment branch distribution systems required for a Level I Trauma Hospital.
g. The proposed emergency-generator-bank concept, including generator quantity and capacity, redundancy, paralleling, fuel-storage requirements, day tanks, main storage tanks, controls, ventilation, exhaust, acoustical treatment, access, maintenance clearances, load management, testing, and future expansion.
h. Required coordination with hospital equipment, elevators, mechanical systems, medical systems, information technology systems, fire-protection systems, security systems, and other critical loads.
i. Required short-circuit, coordination, arc-flash, reliability, resiliency, and load studies.
j. The effect of any Owner-directed modification on the electrical-system configuration, Project cost, construction phasing, site requirements, and continuity of existing ASEM campus operations.

No electrical service concept shall be advanced to final design without verification of the actual available utility and campus conditions, written coordination with the applicable authorities, and confirmation by ASEM of the Owner's operational and resiliency requirements.

3. MECHANICAL COOLING AND AIR-CONDITIONING CONCEPTS

The mechanical narratives describing the proposed central chilled-water system, water-cooled chillers, cooling towers, pumping arrangements, air-handling units, ventilation systems, exhaust systems, controls, redundancy, zoning, and environmental-control concepts establish the preliminary basis of design and minimum performance intent for the Project.

The Design-Build Entity shall review and confirm these concepts with ASEM before final system selection and shall evaluate:

a. The proposed central chilled-water plant capacity and configuration.
b. The recommended three-chiller concept, including operating capacity, standby capacity, redundancy, sequencing, and future expansion.
c. The proposed cooling-tower capacity, configuration, location, screening, structural support, access, maintenance, acoustical impact, plume management, water treatment, and hurricane protection.

d. The chilled-water distribution system, pumping configuration, piping routes, equipment-room arrangements, and interconnection with any existing ASEM campus systems.
e. The air-handling-unit concept for operating rooms, trauma and emergency areas, isolation rooms, critical-care spaces, inpatient areas, diagnostic and treatment departments, support areas, and other hospital functions.
f. Required pressure relationships, filtration levels, temperature and humidity control, ventilation rates, outside-air requirements, infection-control criteria, energy recovery, redundancy, and emergency operation.
g. The required mechanical-system response to loss of utility power, equipment failure, extreme weather events, and other emergency conditions.
h. Coordination with architectural ceiling spaces, structural systems, vertical shafts, equipment access, replacement pathways, electrical loads, plumbing systems, fire protection, medical gases, controls, and building-envelope performance.
i. Requirements for building automation, monitoring, alarms, energy management, testing, balancing, commissioning, and Owner training.
j. Any ASEM-directed change in plant configuration, equipment type, redundancy criteria, capacity, location, or operational philosophy.

Any modification to the recommended mechanical concepts shall demonstrate equal or superior reliability, energy performance, environmental control, infection-control capability, maintainability, durability, resiliency, and life-cycle value.

4. PROGRAMMATIC SPACES, FUNCTIONAL RELATIONSHIPS, AND LAYOUTS

The architectural narratives and Advanced Architectural Design Development Drawings establish the proposed departmental organization, programmatic spaces, room distributions, circulation relationships, adjacencies, functional flows, and preliminary layouts for the Hospital.

These concepts reflect the programmatic information and operational direction available during preparation of the Bridging Documents. The Design-Build Entity shall validate the program with ASEM and the designated hospital users before advancing the final design.

The validation process shall include, as applicable:

a. Departmental scope, room quantities, room sizes, and functional requirements.
b. Patient, staff, public, visitor, service, material, waste, equipment, emergency, and secure circulation.
c. Clinical adjacencies and departmental relationships.
d. Trauma, emergency, surgical, imaging, critical-care, inpatient, support, administrative, and utility functions.
e. Clean and soiled material flows.
f. Infection-prevention and isolation requirements.
g. Patient privacy, staff observation, security, and operational control.
h. Accessibility and universal-design requirements.
i. Equipment, furnishings, casework, medical-gas, power, data, and utility requirements.
j. Future adaptability, expansion, surge capacity, and changes in healthcare delivery.

k. Departmental phasing and temporary operational arrangements required during construction or early occupancy.
l. Coordination with the basement electromechanical and utility areas and the phased turnover of the Basement and First Level contemplated in the Bridging Documents.

The Design-Build Entity shall not materially alter established programmatic relationships, departmental distributions, critical adjacencies, circulation systems, or room functions without first documenting the proposed change and obtaining ASEM's review and written authorization.

5. EXTERIOR ARCHITECTURAL EXPRESSION AND PROJECT IMAGE

The exterior architectural expression, massing, proportions, façade organization, building envelope, material character, fenestration, entrances, canopies, architectural features, and overall institutional image shown or described in the Bridging Documents represent an important component of the Owner's design intent.

The Design-Build Entity shall preserve and further develop the established architectural character while resolving all required technical, structural, environmental, code, energy, hurricane-resistance, water-infiltration, maintenance, durability, constructability, and life-cycle considerations.

Any proposed modification to the exterior design shall be submitted to ASEM for review and shall demonstrate that it:

a. Maintains or enhances the intended institutional identity of the Puerto Rico Trauma Hospital.
b. Is compatible with the existing Puerto Rico Medical Center and adjacent ASEM facilities.
c. Preserves the principal massing, proportions, architectural hierarchy, and visual character established in the Bridging Documents.
d. Provides a durable, maintainable, code-compliant, weather-resistant, and hurricane-resistant building envelope.
e. Integrates exterior materials, glazing systems, louvers, canopies, rooftop elements, mechanical equipment, the heliport, and service components into a coherent architectural composition.
f. Does not diminish the quality, functionality, performance, or public presence of the Project solely for reasons of cost reduction or construction convenience.

Cost-saving proposals or value-engineering recommendations affecting the exterior architectural expression shall be subject to ASEM's prior review and written acceptance.

6. CONNECTIONS TO THE EXISTING ASEM CENTRAL SERVICES BUILDING

The proposed physical, operational, architectural, structural, and utility connections between the new Trauma Hospital and the existing adjacent ASEM Central Services Building are essential Project considerations.

The Design-Build Entity shall verify existing conditions and coordinate with ASEM to confirm the location, elevation, configuration, function, security, accessibility, and operational requirements of each proposed connection.

The final design shall address:

a. Pedestrian, patient, staff, service, equipment, and emergency movement between buildings.
b. Required horizontal and vertical circulation.
c. Fire and smoke separations.
d. Structural independence or integration, including seismic and differential-movement considerations.
e. Weather protection and enclosure continuity.
f. Accessibility and floor-elevation transitions.
g. Security and access control.
h. Infection-control requirements.
i. Utility, communications, fire-alarm, security, mechanical, electrical, plumbing, and other systems interconnections.
j. Temporary protections and continuity of operations during construction.
k. Required modifications to the existing ASEM Central Services Building.
l. Shutdowns, interruptions, tie-ins, testing, and commissioning procedures.
m. Owner-approved phasing and timing of all work affecting the existing facility.

No work affecting an occupied ASEM facility, campus utility, access route, circulation system, or existing operation shall proceed without prior coordination, written authorization, and an approved interruption or phasing plan.

7. CIVIL, SITE, AND CAMPUS-INFRASTRUCTURE CONCEPTS

The civil narratives and preliminary site drawings establish recommended concepts for site access, grading, drainage, utilities, roadways, emergency access, ambulance circulation, pedestrian movement, demolition, excavation, landscaping, and connections to the existing ASEM campus infrastructure.

The Design-Build Entity shall verify these concepts through complete field investigations, certified surveys, utility investigations, geotechnical studies, drainage analyses, traffic and circulation evaluations, and coordination with ASEM and the applicable authorities.

The Design-Build Entity shall be responsible for confirming:

a. Existing property, topographic, utility, pavement, structure, and site conditions.
b. The location, capacity, condition, and ownership of utilities serving the Project.
c. Utilities that shall remain operational and protected during construction.
d. Required relocations, new services, tie-ins, shutdowns, and temporary services.
e. Final grading, drainage, stormwater management, erosion-control, and flood-protection requirements.
f. Ambulance, emergency, service, fire-department, public, and staff access.
g. Required off-site and campus-wide improvements.

h. Protection of adjacent hospitals, institutions, roadways, plazas, utilities, access routes, and ongoing medical operations.
i. The sequencing of deep excavation and basement construction within the constrained campus site.
j. Any Owner-directed changes to site access, circulation, utility routing, phasing, or campus planning.

8. STRUCTURAL-SYSTEM CONCEPTS

The structural narratives establish preliminary recommendations concerning the principal structural system, foundation approach, lateral-force-resisting system, loading criteria, vibration control, equipment support, building-envelope support, rooftop equipment, and heliport-related structural considerations.

The Design-Build Entity's Structural Engineer of Record shall independently verify all structural assumptions and shall develop a complete structural design based on final architectural, civil, mechanical, electrical, equipment, geotechnical, seismic, wind, hurricane, flood, and operational requirements.

The final structural design shall account for:

a. Site-specific geotechnical and subsurface conditions.
b. Deep-excavation and basement-retention requirements.
c. Puerto Rico seismic, wind, hurricane, and applicable risk-category requirements.
d. Hospital operational continuity and post-event performance expectations.
e. Medical, mechanical, electrical, generator, transformer, cooling-tower, water-storage, façade, elevator, and heliport loads.
f. Vibration-sensitive clinical and diagnostic equipment.
g. Structural interfaces with the existing ASEM Central Services Building.
h. Future modifications, expansion, and equipment replacement where required by the Owner.
i. Construction sequencing, temporary support, underpinning, monitoring, and protection of adjacent structures.
j. Coordination with all penetrations, sleeves, openings, embedded items, and building systems.

9. HEALTHCARE, LIFE-SAFETY, AND SPECIAL-SYSTEM REQUIREMENTS

The Design-Build Entity shall supplement the discipline narratives to address all systems and services required for a complete Level I Trauma Hospital, whether or not each requirement is fully described in the Bridging Documents.

These requirements shall include, as applicable:

a. Fire protection, fire alarm, smoke control, and life-safety systems.
b. Plumbing, domestic water, sanitary, storm, and specialty drainage systems.
c. Medical-gas, vacuum, and associated alarm and monitoring systems.

d. Information technology, telecommunications, nurse call, public address, intercommunications, security, access control, surveillance, and emergency communications.
e. Clinical equipment coordination.
f. Vertical transportation.
g. Building automation and integrated controls.
h. Emergency management, resiliency, and disaster-response requirements.
i. Testing, balancing, commissioning, certification, validation, and Owner training.
j. Regulatory and accreditation requirements applicable to healthcare facilities.

10. CHANGES, ALTERNATIVES, AND DEVIATIONS

The Design-Build Entity may propose refinements, alternatives, innovations, or modifications to the narrative recommendations where such changes are consistent with the Design-Build Agreement and provide demonstrable benefit to the Project.

Each proposed deviation shall be submitted to ASEM with sufficient technical documentation to identify:

a. The original narrative recommendation.
b. The proposed alternative.
c. The reason for the proposed change.
d. Effects on program, operations, performance, reliability, safety, maintainability, durability, energy consumption, life-cycle cost, schedule, and construction cost.
e. Effects on other disciplines and Contract Documents.
f. Required regulatory or utility approvals.
g. Any effect on the exterior architectural expression or Owner-approved design intent.
h. Any effect on future expansion, redundancy, resiliency, or emergency operation.

No material deviation from the Owner's program, established design intent, critical systems, functional relationships, campus connections, utility concepts, or operational requirements shall be incorporated into the final design without ASEM's prior written acceptance.

11. COORDINATION AND FINAL RESPONSIBILITY

The Design-Build Entity shall coordinate the final narratives, calculations, drawings, specifications, equipment selections, models, schedules, reports, and construction requirements among all disciplines and shall resolve all conflicts, gaps, inconsistencies, and interfaces before issuance of the final construction documents.

The absence of a particular detail, system component, design requirement, service, calculation, or coordination item from the Bridging Narratives shall not be interpreted as excluding that item from the Project or relieving the Design-Build Entity from providing a complete, safe, code-compliant, fully operational, durable, maintainable, and properly coordinated facility.

The final design and construction documents shall meet or exceed the programmatic, functional, performance, quality, architectural, technical, resiliency, and operational

requirements established by the Bridging Documents, the accepted Design-Build proposal, ASEM's confirmed requirements, the final Design-Build Agreement, applicable laws and regulations, governing codes and standards, healthcare requirements, utility requirements, authorities having jurisdiction, and accepted professional and construction-industry practices.

The Design-Build Entity and its Architect and Engineers of Record shall retain full professional and contractual responsibility for the final design, engineering, multidisciplinary coordination, permitting, constructability, code compliance, system performance, construction documents, and successful completion of the Project.

1.0 BRIDGING DOCUMENTS INTRODUCTION

This Final Report forms part of the Bridging Documents prepared for the New Puerto Rico Trauma Hospital at the Puerto Rico Medical Center. The purpose of the Bridging Documents is to establish the project's suggested design intent, technical direction, performance requirements, and baseline criteria for use in the procurement of a Design-Build Entity through a Request for Proposals process.

The Bridging Documents will be used by the Owner during the Request for Proposals procurement process to select the Design-Build Entity responsible for completing the design development, preparing the final construction documents, and constructing the New Puerto Rico Trauma Hospital. They are intended to provide a coordinated framework that communicates the Owner's expectations for the project while allowing the Design-Build Entity to complete the final design, engineering coordination, permitting, construction documents, and construction execution in accordance with applicable codes, regulations, healthcare standards, and project requirements.

The Bridging Documents include the Final Report, the Advanced Architectural Design Development Documents, and the Preliminary Technical Specifications. Together, these documents define the intended scope, programmatic organization, architectural and engineering objectives, resilience and operational performance goals, suggested probable construction cost, and suggested project itinerary. They are not intended to serve as final construction documents, but rather as the basis for the Design-Build proposal, validation, development, and final implementation of the project.

The Final Report includes the Existing and Proposed Project Lot Placement, Architectural, Structural, Mechanical, and Electrical Design Narratives. These components summarize the principal design assumptions and requirements that shall guide the Design-Build Entity in advancing the project while preserving the essential design intent, functional relationships, operational objectives, and performance expectations established for the New Puerto Rico Trauma Hospital.

During the procurement process, the Owner may request clarifications, revisions, changes, or deviations to the Final Report and related Bridging Documents as may be required to address procurement objectives, project requirements, funding considerations, regulatory comments, or other Owner-directed determinations prior to final selection and implementation.

4.0 PROPOSED PROJECT VIEWS

The proposed project views are provided as visual instruments of work to support the understanding and interpretation of the Architectural Advanced Design Documents and the design intent established in the Bridging Documents. These three-dimensional views illustrate the intended architectural character, building massing, façade expression, spatial relationships, and general design direction of the New Puerto Rico Trauma Hospital. They are not intended to define final construction details, means and methods, or fully resolved technical solutions. The Design-Build Entity shall use these views as interpretative representations of the proposed design concept and shall further develop, coordinate, and complete the final design in accordance with the Bridging Documents, applicable requirements, and the Owner's final approval, while preserving the essential architectural intent of the project.

5.0 ARCHITECTURAL DESIGN NARRATIVE

5.1 INTRODUCTION SUMMARY

5.1.1 Purpose of This Narrative

This Architectural Design Intent Narrative forms part of the Design-Build Bridging Documents for the Puerto Rico Trauma Hospital project. It establishes the Owner's design intent, minimum project requirements, planning principles, performance objectives, and compliance expectations for the final development of the facility. The Narrative shall be used by the Design-Build Entity as a controlling reference for final design, interdisciplinary coordination, permitting, construction documentation, and construction of the project.

5.1.2 Project Mission and Scope

The Puerto Rico Trauma Hospital shall be developed as a new tertiary-care healthcare facility dedicated to advanced trauma, emergency, critical care, surgical, rehabilitation, diagnostic, inpatient, administrative, educational, and disaster-response services. The project shall strengthen the trauma care capacity of the Puerto Rico Medical Center and shall support the long-term healthcare mission of ASEM.

5.1.3 Campus Integration and Clinical Planning

The new Trauma Hospital shall function as an integrated extension of the existing ASEM Central Services Building and the broader Puerto Rico Medical Center campus. The Design-Build Entity shall preserve the required relationship between both buildings, including physical interconnection, operational continuity, coordinated circulation, shared services, existing utility access, and uninterrupted healthcare operations during design, permitting, phasing, construction, and final occupancy. The hospital shall maintain clear departmental relationships among emergency services, trauma stabilization, surgical services, imaging, critical care, inpatient care, rehabilitation, and support services to reduce travel distances and support timely clinical intervention.

5.1.4 Resilience and Vertical Circulation

Resilience shall be a fundamental requirement of the project. The hospital shall be planned, designed, and constructed to support continuous healthcare operations, patient safety, emergency response, disaster preparedness, and post-event recovery during hurricanes, earthquakes, utility disruptions, mass-casualty incidents, public health emergencies, and other major events.

The seismic isolation strategy, resilient building systems, emergency operations areas, ADA-compliant ramp system, protected vertical circulation, and building support infrastructure shall be coordinated as part of the hospital's overall continuity-of-operations strategy. Vertical circulation systems shall support safe patient movement, staff operations, emergency response, stretcher transport, service access, and evacuation needs during normal operations and post-event conditions.

The ADA-compliant ramp system shall be maintained as a significant planning and operational element of the project. It shall support accessible circulation, patient and staff movement, emergency response, and functional connectivity between hospital levels, including coordination with heliport-related patient transfer routes where applicable.

5.1.5 Continuous Ramp Accessibility and Vertical Circulation

The Advanced Architectural Design Development for the Puerto Rico Trauma Hospital incorporates a continuous system of ramps as an essential component of the Project's vertical circulation, accessibility, operational resiliency, and emergency-response strategy. The design includes a continuous interior ramp system extending from the Basement Level through the Ninth Level, providing ramp access to each principal occupied floor of the Hospital, together with a continuous exterior ramp system extending from the Ninth Level to the rooftop Heliport Touchdown and Liftoff Area (TLOF).

The Design-Build Entity shall maintain, preserve, and fully incorporate these ramp assemblies as integral elements of the final Project design and shall not eliminate, interrupt, substantially reduce, or otherwise modify their intended continuous connectivity, accessibility, or operational function without the prior review and written acceptance of ASEM. During final design development, the Design-Build Entity, through its Architect and Engineers of Record, shall verify, coordinate, refine, and document the complete ramp systems and all associated architectural, structural, life-safety, drainage, lighting, weather-protection, guardrail, handrail, and other required components.

All ramps shall be designed and constructed to provide a fully accessible continuous route in accordance with the applicable ADA accessibility requirements, Puerto Rico Building Code requirements, applicable life-safety provisions, healthcare design criteria, and all other governing codes and standards. Compliance shall include, without limitation, maximum permitted running and cross slopes, required intermediate and floor-level landings, landing dimensions, clear widths, maneuvering clearances, handrails, guards, edge protection, surface characteristics, slip resistance, headroom, transitions, door clearances, signage, illumination, and all other features necessary to achieve safe, continuous, and unobstructed accessible circulation.

The intent of the continuous ramp systems is to provide an independent means of vertical circulation throughout the Hospital that may be utilized by patients, including patients with mobility limitations or requiring assisted movement, healthcare personnel, visitors, emergency responders, rescue personnel, and other authorized users without dependence upon the building elevators or stairs. The ramp systems shall therefore be developed as an integral component of the Hospital's accessibility, operational continuity, emergency preparedness, patient movement, rescue, and evacuation strategy, to the extent permitted and required by the applicable codes, approved life-safety design, and ASEM's operational and emergency-management requirements.

The Design-Build Entity shall coordinate the final ramp design with all required means-of-egress, accessible-means-of-egress, fire and life-safety, smoke-control, compartmentation, emergency-power, security, and emergency-response provisions of the Hospital so that the

continuous ramp systems remain functional, safe, accessible, and capable of supporting the intended movement of building occupants and emergency personnel under both normal operating conditions and emergency conditions.

5.1.6 Heliport Operations

The rooftop heliport shall be treated as a critical operational component of the Trauma Hospital and not solely as an occasional emergency-use feature. The Design-Build Entity shall coordinate the proposed new rooftop heliport with the continued use of the existing ASEM Central Services Building helipad during planning, design, construction, transition, activation, and operational coordination.

The Design-Build Entity shall be responsible for all required FAA notices, determinations, approvals, authorizations, permits, filings, and related coordination required for the proposed rooftop heliport and for any required coordination associated with the existing helipad. This coordination shall include the Owner, FAA, helicopter operators, emergency medical transport stakeholders, and all applicable Authorities Having Jurisdiction.

As required by the Owner, the new rooftop heliport shall be designed to support helicopter operations up to and including the Sikorsky S-92 (Including the military VH-92A Patriot version) presidential helicopter, or the controlling aircraft criteria identified by the Owner, FAA, and applicable authorities. The Touchdown and Liftoff (TLOF) Area shall be not less than 69'-0" x 69'-0", as shown in these Bridging Documents, and shall be coordinated with the final controlling aircraft requirements. The Final Approach and Takeoff (FATO) Area shall be 100'-0" x 100'-0", or as otherwise required by FAA criteria and applicable approvals.

The heliport infrastructure, including the structural deck and supporting systems, shall be constructed of reinforced concrete to provide durability, resilience, and the structural capacity required for the controlling aircraft and operational demands.

The heliport design shall include all required structural capacity, landing area configuration, lighting, markings, safety provisions, access control, fire/life safety coordination, drainage, aviation-related signage, and protected patient transfer routes necessary to support safe and reliable rooftop heliport operations. The Design-Build Entity shall develop and provide a comprehensive rooftop heliport technical specification under CSI Division 34, including Section 34 73 73 – Rooftop Heliports, together with all other related and applicable CSI divisions and sections necessary to fully define, coordinate, furnish, install, test, and commission the heliport and its associated structural, architectural, electrical, mechanical, plumbing, fire protection, communications, security, and specialty systems.

5.1.7 Design-Build Responsibility

The Design-Build Entity shall adhere to the Architectural Design Narrative, Structural Design Narrative, Mechanical Design Narrative, Electrical Design Narrative, Advanced Architectural Design Development documents, and all other Bridging Documents. These documents collectively establish the Owner's requirements for clinical planning, structural resilience, seismic isolation, building systems performance, infrastructure, operational continuity, maintainability, architectural character, and regulatory compliance.

This Narrative shall not be interpreted as a general description only. Requirements stated herein shall be treated as minimum Owner requirements unless specifically modified by the Owner in writing. The Design-Build Entity shall be responsible for providing a complete, coordinated, code-compliant, permit-ready, constructible, and operationally effective final design that faithfully advances the Owner's vision for the Puerto Rico Trauma Hospital.

5.2 PROJECT SUMMARY

5.2.1 Project Overview

The Puerto Rico Trauma Hospital shall be developed as a new tertiary-care healthcare facility dedicated to the delivery of advanced trauma, emergency, critical care, surgical, rehabilitation, and related specialized medical services. The project shall strengthen and expand the trauma care capabilities of the Puerto Rico Medical Center through a dedicated hospital facility designed to support the present and future healthcare needs of Puerto Rico.

The proposed facility shall consist of an approximately 215,880-square-foot hospital distributed over ten levels, with an interstitial seismic isolation level and a rooftop helipad. The hospital shall have a capacity of 110 patient beds and the capability to expand operations during emergency conditions to accommodate a surge capacity of approximately 182 total beds. The hospital shall provide a comprehensive range of trauma-related services, including emergency care, surgical services, critical care, diagnostic imaging, inpatient nursing care, rehabilitation services, medical education, administrative functions, and disaster response support services.

This Architectural Design Intent Narrative forms part of the Bridging Documents prepared for the Design-Build procurement of the project and establishes the Owner's vision, minimum design requirements, performance requirements, and expectations for the final development of the Puerto Rico Trauma Hospital. The Design-Build Entity shall implement the design intent described herein and shall develop the final design, construction documents, specifications, coordination documents, permit documents, and constructed work in a manner consistent with the Owner's approved program, the Advanced Architectural Design Development documents, the Bridging Documents, and all applicable codes, regulations, standards, and authority requirements.

The Design-Build Entity shall not interpret this Narrative as a general description only. Requirements stated in this Narrative, the Advanced Architectural Design Development Documents, program summary, and related Bridging Documents shall be treated as minimum Owner requirements unless specifically modified by the Owner in writing. The Design-Build Entity shall be responsible for confirming all requirements with the Owner and for providing a complete, coordinated, code-compliant, permit-ready, and constructible final design.

Resilience shall be a fundamental design requirement for the Puerto Rico Trauma Hospital. The facility shall be planned, designed, and constructed to support continuous hospital operations, patient safety, emergency response, and post-event recovery during hurricanes,

earthquakes, utility disruptions, mass-casualty incidents, and other major emergency conditions. As part of the hospital's resilient vertical circulation strategy, the Design-Build Entity shall maintain and fully coordinate the ADA-compliant ramp system shown in the Advanced Architectural Design Development documents. The ramp shall serve daily operational use and shall also support emergency patient movement through the hospital when elevators or other vertical transportation systems are limited, interrupted, or being controlled for emergency operations. The ramp shall provide an accessible, safe, and dignified means to move patients, staff, visitors, equipment, and emergency response personnel between levels, while complementing all code-required stairs, elevators, areas of refuge, life-safety systems, and emergency egress requirements.

The project shall recognize the heliport as a critical operational component of the Puerto Rico Trauma Hospital and not solely as an occasional emergency-use feature. Helicopter access shall support the day-to-day mission of a Level I trauma facility, including time-sensitive trauma response, interfacility transfers, specialized patient transport, disaster response, and continuity of emergency medical operations. The Design-Build Entity shall preserve and enhance the functional role of helicopter access as an integral part of the hospital's clinical operations, patient transfer strategy, and emergency preparedness mission.

The new heliport shall be designed to accommodate the arrival and operation of the Sikorsky S-92 (Including the military VH-92A Patriot version) presidential helicopter, or the controlling aircraft criteria identified by the Owner and applicable federal authorities. The helipad shall be designed with sufficient capacity to accommodate, at a minimum, the operational, dimensional, structural, clearance, safety, and load requirements required for the presidential helicopter. The Design-Build Entity shall ensure that the heliport design supports the safe landing, takeoff, approach, departure, patient transfer, and ground operations of the required aircraft type in coordination with applicable federal authorities, ASEM, emergency medical transport stakeholders, and all authorities having jurisdiction.

The Design-Build Entity shall coordinate the proposed new heliport with the continued use of the existing helipad located at the ASEM Central Services Building. The existing helipad shall remain operational to the extent required by the Owner and applicable authorities during design, permitting, phasing, and construction, unless an alternate temporary operational plan is reviewed and accepted by ASEM and all authorities having jurisdiction. The final design shall provide safe, compliant, and coordinated helicopter access, including patient transfer routes, operational clearances, approach and departure considerations, security, lighting, signage, structural requirements, fire/life-safety coordination, and integration with the hospital's emergency and critical care functions.

5.2.2 Design Intent

The design intent for the Puerto Rico Trauma Hospital shall be implemented by the Design-Build Entity in accordance with the principles of clinical excellence, patient-centered care, operational efficiency, resiliency, flexibility, and long-term sustainability.

The final design shall provide safe, functional, durable, and adaptable healthcare environments that respond to the specialized requirements of trauma care while maintaining a

high standard of quality, dignity, and comfort for patients, visitors, and healthcare professionals. The Design-Build Entity shall develop the project in a manner that supports efficient medical operations, enhances patient outcomes, promotes staff effectiveness, and accommodates future advancements in healthcare delivery and technology.

The Advanced Architectural Design Development documents prepared as part of the Bridging Documents establish the clinical planning framework, architectural organization, building form, and overall design direction for the project. These elements shall guide the Design-Build Entity in the final development of the facility and shall not be substantially modified without Owner review and written acceptance.

5.2.3 Owner Objectives

The Owner's primary objective, to be implemented by the Design-Build Entity, is to develop a state-of-the-art trauma hospital capable of providing advanced trauma and critical care services while supporting the long-term mission of the Puerto Rico Medical Services Administration (ASEM) and the healthcare objectives of the Puerto Rico Medical Center.

The Design-Build Entity shall preserve and advance the clinical, functional, operational, and architectural vision established during the planning and design process. Through the Bridging Documents, the Owner has defined the fundamental requirements, planning principles, and design criteria necessary to ensure continuity between the approved design concept and the completed facility.

The Design-Build Entity shall implement the following Owner objectives:

- Establish a modern healthcare facility dedicated to trauma and critical care services.
- Preserve the approved clinical planning concepts, functional organization, and architectural design vision developed during the project's planning and design phases.
- Support efficient healthcare delivery through evidence-based planning and operationally effective design solutions.
- Provide a facility capable of adapting to future healthcare demands, technological advancements, and changing operational requirements.
- Create safe, accessible, durable, and healing environments that support patients, visitors, and healthcare professionals.
- Maintain the approved hospital capacity of 110 proposed beds and surge capacity for approximately 182 total beds.
- Provide a resilient trauma facility capable of supporting disaster preparedness, operational continuity, and post-event recovery.
- Ensure compliance with all applicable healthcare, life-safety, accessibility, aviation, environmental, and regulatory requirements.

These objectives shall form the basis for the design criteria and performance requirements established throughout the Bridging Documents.

5.2.4 Design-Build Expectations

The Bridging Documents establish the Owner's Project Requirements and the architectural, functional, operational, and technical framework within which the Design-Build Entity shall develop the final design and construction documents for the project.

The Design-Build Entity shall preserve the fundamental planning concepts, clinical relationships, functional organization, operational objectives, patient care capacity, and architectural design intent established by the Bridging Documents. The purpose of these documents is to maintain continuity between the vision developed during the planning and design process and the facility ultimately delivered to the Owner.

Design-Build flexibility shall be used primarily to facilitate engineering development, constructability improvements, interdisciplinary coordination, permitting, system integration, life-cycle performance, and the preparation of complete construction documents. Such flexibility shall not be interpreted as authorization to significantly modify the intent of the Advanced Architectural Design Development documents or the design concepts that form the basis of the project.

The Design-Build Entity shall prepare and furnish a complete, coordinated, permit-ready, and construction-ready set of documents for all Project disciplines, systems, and components, as required for permitting, procurement, construction, testing, commissioning, occupancy, and Project closeout. The construction documents shall include all architectural and engineering plans, specifications, calculations, schedules, details, diagrams, technical data, delegated-design documents, coordination documents, permit submissions, and other information necessary to fully define and execute the Work and to deliver a complete, suitable, functional, code-compliant, and effective facility for its intended healthcare use. The Bridging Documents shall not be construed as a substitute for the development, detailing, verification, interdisciplinary coordination, or documentation required of the Design-Build Entity's final construction documents.

The Design-Build Entity shall assume that ASEM will require an independent third-party peer review of the construction-related documents prepared by the Design-Build Entity and its Architect and Engineer(s) of Record. As directed by ASEM, the Design-Build Entity shall procure and coordinate qualified independent peer-review professionals acceptable to the Owner; submit the applicable drawings, specifications, calculations, reports, studies, and technical documentation; participate in review meetings; respond to comments; incorporate accepted comments; and revise and resubmit documents as required until review items are satisfactorily resolved. The Design-Build Entity shall incorporate the peer-review process into its design schedule and document-control procedures. Such review shall constitute an additional quality-assurance measure and shall not relieve, transfer, or diminish the responsibility of the Design-Build Entity or its licensed Architect and Engineer(s) of Record for the completeness, accuracy, interdisciplinary coordination, code compliance, permitting, constructability, and final content of the construction documents.

The Design-Build Entity shall deliver a completed facility that faithfully advances the vision, objectives, and design intent established by the Owner while meeting the performance, quality, regulatory, permitting, operational, and construction requirements of the project.

5.3 SITE AND CAMPUS DESIGN INTENT

5.3.1 Existing Campus Context

The project site is located within the Puerto Rico Medical Center campus and occupies a mainly rectangular-shaped lot of land of approximately 6,860 square meters located immediately adjacent to the existing ASEM Central Services Building. The site is generally bounded by the ASEM Central Services Building to the north, the Pedro Arzuaga Beraza Plaza to the south, the Oncological Hospital to the east, and the San Juan Municipal Hospital to the west.

The Design-Build Entity shall develop the new Trauma Hospital as an integrated component of the established Medical Center infrastructure while maintaining close proximity to existing healthcare facilities, utilities, vehicular and pedestrian circulation systems, and institutional support services. The final site design shall respond to the physical constraints of the surrounding development, existing campus operations, and the requirement to maintain continuity of healthcare services throughout design, permitting, phasing, and construction activities.

The Design-Build Entity shall verify existing utilities, grades, access conditions, adjacent operations, underground and overhead constraints, existing helipad operations, and construction phasing limitations. The final design shall avoid disruption to critical healthcare operations except as specifically reviewed and accepted by ASEM and all applicable authorities having jurisdiction.

5.3.2 Site Organization and Access

The Design-Build Entity shall maintain the fundamental site organization established by the Advanced Architectural Design Development documents. The site shall be organized to maximize the efficient use of the available development area while supporting the operational requirements of a high-acuity healthcare facility. Building placement, vehicular and pedestrian circulation systems, service areas, and access points shall establish clear relationships between public, emergency, staff, service, and operational functions. The new building shall also respect the separation distances required by Puerto Rico regulations to comply with setback requirements relative to surrounding buildings on the site.

The Design-Build Entity shall preserve the required physical separation between the new Trauma Hospital and the existing ASEM Central Services Building to maintain access to existing utilities, service areas, maintenance zones, building systems, and operational infrastructure. This separation shall support the continued operation, inspection, repair, and maintenance of existing ASEM systems during design, permitting, phasing, construction, and future hospital operations. At the same time, the final design shall provide the required functional

interconnection between both buildings to support integrated hospital operations, coordinated circulation, shared services, and continuity between the new Trauma Hospital and the existing ASEM Central Services Building.

The access points of the Trauma Hospital shall maintain the planning intent established in the Bridging Documents. To the north, the Design-Build Entity shall provide the interconnection and integration between the ASEM Central Services Building and the Trauma Hospital. To the south, the Design-Build Entity shall provide a drop-off canopy serving the Trauma Hospital visitor and administrative staff main entrance to the right, and the ASEM Emergency walk-in initial services to the left. To the east, the Design-Build Entity shall coordinate the ASEM Central Services Building visitor main entrance and service and maintenance access. To the west, the Design-Build Entity shall provide ambulance arrival, secure patient drop-off, and controlled access to the enclosed ambulance parking yard and service access areas.

The ambulance entrance and enclosed ambulance parking yard shall be treated as critical security and emergency-response components of the project. The Design-Build Entity shall provide a controlled ambulance arrival sequence that allows emergency vehicles to enter a protected area, transfer patients safely, and exit or stage without creating conflicts with public, visitor, staff, or service circulation. The enclosed ambulance yard shall include appropriate perimeter protection, controlled security gates, access control, visibility, lighting, communication systems, and coordination with ASEM security operations to protect patients, emergency medical personnel, staff, visitors, and surrounding hospital occupants during high-risk patient arrivals or other security-sensitive events.

The Design-Build Entity shall provide efficient vehicular and pedestrian circulation while minimizing conflicts between patient, visitor, emergency, service, and staff traffic. Emergency vehicle access, patient arrival sequences, secure ambulance operations, service operations, accessible routes, pedestrian safety, and construction phasing shall be coordinated with ASEM operations and all applicable codes.

The final site organization shall support operational efficiency, functional flexibility, long-term adaptability, emergency response, service reliability, security, maintainability, and compatibility with surrounding campus facilities and infrastructure.

5.3.3 Campus Integration

The Design-Build Entity shall physically and operationally integrate the new facility with the existing ASEM Central Services Building and the broader Medical Center campus. The proposed trauma hospital shall be developed to facilitate direct connectivity, coordinated circulation, and efficient interaction with adjacent institutional facilities.

The final site design shall support the use of shared infrastructure, promote continuity between existing and new operations, and reinforce the established campus development pattern. The Design-Build Entity shall preserve the fundamental relationships established between the proposed facility, the ASEM Central Services Building, the existing helipad, the proposed new heliport, and the surrounding Medical Center environment.

5.4 BUILDING PLANNING DESIGN INTENT

5.4.1 Building Organization

The Design-Build Entity shall organize the building around a clear hierarchy of clinical, inpatient, administrative, and support functions distributed vertically to promote operational efficiency and functional clarity. Departments with similar operational requirements shall remain grouped while maintaining direct relationships between services that require frequent interaction.

Lower levels shall accommodate the most intensive treatment and diagnostic activities, while upper levels shall be dedicated primarily to inpatient care and administrative functions. Building support services, utility infrastructure, operational departments, and disaster accommodations shall be located in areas that support efficient facility operation without compromising clinical activities. The resulting organization shall establish a clear framework for patient care delivery, staff operations, and hospital support services.

5.4.2 Functional Stacking

The Design-Build Entity shall maintain the vertical arrangement of departments established in the Bridging Documents. The Trauma Hospital shall be organized over ten levels, with an interstitial seismic isolation level and a rooftop helipad. Functional stacking shall support the operational sequence of hospital services, the intensity of care provided within each functional area, and the required relationships between emergency, diagnostic, surgical, critical care, inpatient, rehabilitation, administrative, disaster response, and support functions.

The basement level shall contain major utility systems, storage, operational support departments, educational facilities, nursing administration, cafeteria services, and emergency disaster accommodations. The ground level shall accommodate emergency, surgical, imaging, stabilization, observation, and critical care services together with principal public access functions. An interstitial seismic isolation level shall separate the ground floor from the occupied levels above.

The second and third levels shall contain specialized clinical and support functions, including intensive care, rehabilitation services, medical staff facilities, operational departments, and visitor amenities. Rehabilitation services and related clinical support functions shall also support continuity of care for outpatient services, as required by the approved program and operational requirements. Levels four through seven shall be dedicated to inpatient nursing units organized into consistent nursing wings with associated support spaces. Administrative departments shall occupy the eighth level, while the uppermost occupied level shall accommodate disaster operations, building systems, and heliport support functions.

The final stacking shall support hospital operations, efficient access to shared services and resources, continuity of inpatient and outpatient care, and clear clinical relationships between emergency, trauma stabilization, surgical services, intensive care, imaging, inpatient care, rehabilitation, and support functions.

5.4.3 Departmental Relationships

The Design-Build Entity shall maintain direct operational relationships among departments that routinely share patients, staff, equipment, or support services. Clinical departments requiring frequent interaction shall be positioned to minimize travel distances and simplify operational coordination.

Critical treatment functions shall remain grouped to facilitate efficient patient transfers, rapid clinical intervention, and staff communication. Inpatient nursing units shall be organized around centralized support functions to improve operational efficiency and provide consistent care environments throughout the patient tower. Rehabilitation services, medical staff functions, administrative departments, and operational support areas shall be positioned to support the overall workflow of the facility while maintaining appropriate separation from acute-care activities.

The Design-Build Entity shall provide efficient distribution of supplies, equipment, environmental services, and operational resources throughout the building. Any proposed modification affecting major departmental relationships shall be submitted for Owner review and written acceptance prior to incorporation into the final design.

5.4.4 Circulation Strategy

The Design-Build Entity shall provide a circulation system with distinct movement patterns for patients, visitors, staff, supplies, equipment, and service functions. Circulation shall reduce operational conflicts, simplify wayfinding, protect patient privacy, support infection prevention, and improve daily hospital operations.

Public circulation shall be concentrated around primary arrival, registration, waiting, and visitor support areas. Clinical circulation shall support movement between treatment, diagnostic, inpatient, critical care, surgical, and rehabilitation functions. Staff circulation shall facilitate access to work areas, support departments, educational facilities, and operational spaces.

Service circulation shall support materials management, food service, environmental services, equipment movement, waste handling, and building operations. Vertical transportation systems shall be distributed to accommodate the differing requirements of public access, patient transport, staff operations, service activities, emergency transport, and heliport patient transfer functions.

The Design-Build Entity shall maintain and coordinate the ADA-compliant ramp system established in the Advanced Architectural Design Development documents as part of the hospital's vertical circulation and resilience strategy. The ramp shall extend from the basement level to the ninth level and shall support movement of patients, staff, visitors, equipment, and service functions between floors. The ramp shall also serve as an important emergency circulation component when elevators are limited, interrupted, dedicated to emergency operations, or otherwise unavailable during a major event.

At the ninth level, the ramp system shall be coordinated with the heliport support functions and patient transfer routes associated with rooftop helicopter operations. The final design shall allow patients arriving by helicopter to be moved safely, efficiently, and with dignity from the heliport support level to the appropriate clinical destination within the hospital. The ramp system shall also serve as an emergency route to support patient, staff, and operational movement during emergency conditions.

5.5 DEPARTMENTAL DESIGN INTENT

5.5.1 Emergency Department

The Design-Build Entity shall recognize that the principal Emergency Department is located within the existing ASEM Central Services Building and that the new Trauma Hospital shall provide emergency access and initial emergency service functions that integrate with the existing ASEM Emergency Department. The final design shall maintain the physical and operational interconnection between both buildings through coordinated corridors and circulation routes to support continuous emergency services, patient movement, staff coordination, and access to diagnostic, treatment, surgical, critical care, and support functions.

Within the new Trauma Hospital, the Design-Build Entity shall provide the ASEM Emergency Department Entrance, including public waiting, registration, triage, fast track services, and required support areas. These functions shall serve as the primary public interface for emergency care and complement the Emergency Department services located within the ASEM Central Services Building. The design shall support efficient arrival, intake, assessment, and appropriate transfer or continuation of care through the interconnected emergency services network. The design shall accommodate both ambulance arrivals and walk-in patients, with clearly defined and separate access points and circulation paths for each. Dedicated triage areas shall be provided for ambulance arrivals and for walk-in patients to ensure efficient patient sorting, prioritization, and flow based on acuity.

The final design shall maintain clear operational relationships between the ASEM Emergency Department Entrance, trauma stabilization, observation, imaging, surgical services, critical care functions, vertical transportation, and the existing Emergency Department functions within the ASEM Central Services Building. Patient movement shall occur through coordinated and controlled circulation routes with minimal travel distance between critical treatment areas to support timely clinical intervention and continuity of care.

The emergency department entrance shall include dedicated areas for reception, registration, waiting, triage, fast track services, ambulance operations, trauma stabilization, observation, and required support functions, as established in the Advanced Architectural Design Development documents. The Design-Build Entity shall maintain the functional relationships that support efficient emergency and trauma care operations and shall verify all room sizes, clearances, accessibility, infection-control requirements, medical gases, utilities, visibility,

security, staff support requirements, and code compliance in accordance with applicable healthcare standards and codes.

5.5.2 Surgical Services

The Design-Build Entity shall provide a Surgical Services Department that functions as the primary operative platform supporting trauma care activities within the hospital. The department shall include five operating rooms together with the required preoperative, postoperative, clinical support, and staff support functions.

The final design shall support efficient patient movement through the perioperative process while maintaining direct operational relationships with the Emergency Department, Trauma Intensive Care Units, imaging services, inpatient care units, vertical transportation, and sterile processing services supported by ASEM's main Sterile Processing Department.

Surgical support areas shall remain organized to facilitate efficient clinical operations, staff workflow, sterile supply movement, soiled material handling, equipment movement, and patient care activities. The Design-Build Entity shall preserve the departmental organization and functional relationships established within the surgical platform while developing the final detailed design in compliance with applicable healthcare codes and standards.

5.5.3 Critical Care

The Design-Build Entity shall provide Critical Care services that support intensive monitoring and treatment for patients requiring the highest level of clinical care following trauma, surgery, or other acute medical conditions. Critical Care shall include dedicated intensive care units organized as private patient rooms with designated isolation capacity.

The final design shall establish nursing-centered patient care environments that support continuous observation, rapid clinical response, infection prevention, patient dignity, family participation, and efficient access to treatment resources. Critical Care units shall maintain close operational relationships with Surgical Services, Emergency Department functions, imaging services, inpatient nursing units, and vertical transportation.

The Design-Build Entity shall preserve the organization of patient care spaces, nursing support functions, clean and soiled support, medication areas, equipment storage, clinical support rooms, and staff support areas necessary for intensive care operations.

5.5.4 Inpatient Units

The Design-Build Entity shall provide inpatient nursing units that support progressive levels of patient recovery and care following trauma treatment. The proposed program shall include telemetry, rehabilitation, intermediate care, and related inpatient services organized within dedicated nursing units located on the upper clinical floors of the hospital.

The final design shall provide private patient accommodations with designated isolation capacity while supporting efficient nursing operations, patient monitoring, accessibility, infection control, patient dignity, and family support. Patient rooms shall be organized within nursing unit configurations that promote operational efficiency, staff accessibility, supply distribution, environmental services, and appropriate patient support services.

The Design-Build Entity shall maintain the established nursing unit organization, patient room strategy, and departmental support functions that form the basis of inpatient care delivery. Any proposed change affecting proposed bed count, surge capacity, patient room configuration, isolation capacity, or nursing unit functionality shall require Owner review and written acceptance.

5.5.5 Diagnostic and Treatment Services

The Design-Build Entity shall provide Diagnostic and Treatment Services necessary to support emergency, surgical, critical care, inpatient, outpatient, and rehabilitation operations. These services shall include imaging, rehabilitation, minor procedures, and related treatment functions required for a tertiary trauma facility.

The final design shall maintain close functional integration between diagnostic services and the primary patient care departments to facilitate timely access to clinical information, treatment resources, and patient support services. Rehabilitation services shall support both inpatient and outpatient patient populations as part of the recovery continuum.

The Design-Build Entity shall maintain the operational relationships between diagnostic, treatment, and patient care functions established by the Advanced Architectural Design Development documents.

5.5.6 Support Services

The Design-Build Entity shall provide Support Services that form the operational infrastructure necessary for continuous hospital operations. These functions shall include materials management, storage, administrative support, educational facilities, food services, staff support areas, emergency management functions, and building operational support departments.

Support Services shall be organized to support clinical departments while minimizing interference with patient care activities. Administrative, educational, and operational support functions shall be distributed throughout the facility according to their relationship with the departments they serve.

The Design-Build Entity shall preserve the operational support framework established for the hospital and maintain the functional relationships required to support clinical, administrative, educational, service, and emergency preparedness activities throughout the facility.

5.6 ARCHITECTURAL CHARACTER AND INTERIOR ENVIRONMENT

5.6.1 Building Form and Massing

The Design-Build Entity shall maintain the architectural character of the Trauma Hospital as a vertically organized clinical tower rising above a highly specialized diagnostic and treatment podium. The building shall present a clear and efficient institutional form that reflects its role as Puerto Rico's principal trauma care facility.

Upper patient care floors shall remain organized in repetitive nursing unit configurations that provide operational consistency, facilitate future adaptability, and establish a recognizable architectural identity throughout the tower. The building massing shall culminate with the trauma heliport and associated emergency transport facilities, reinforcing the hospital's role as a regional destination for critical and emergency care.

5.6.2 Architectural Expression and Façade Design

The Design-Build Entity shall provide exterior architecture that conveys a contemporary healthcare image characterized by simplicity, permanence, and resilience. The façade composition shall emphasize the rhythm of patient room modules, vertical circulation elements, family coves, and major clinical components while maintaining a unified architectural appearance.

Family coves within patient bedrooms shall be maintained as an important patient-centered design feature. These areas shall provide natural illumination within the patient room environment and shall support family presence, patient comfort, and healing. The expression of the family coves shall be coordinated with the façade design, window rhythm, and volumetric massing so that they contribute to the architectural identity of the patient tower and reinforce the relationship between interior patient care environments and the exterior expression of the building.

Exterior terraces incorporated into patient, visitor, and staff areas shall serve as visible architectural features that contribute to occupant well-being and provide visual relief within the hospital environment. Architectural detailing shall prioritize durability, weather resistance, corrosion resistance, and ease of maintenance appropriate for the climatic conditions of Puerto Rico.

5.6.3 Building Envelope

The Design-Build Entity shall select and provide exterior envelope materials and systems in accordance with the Advanced Architectural Design Development documents, the Bridging Documents, and the Owner’s approved design intent. Exterior envelope materials and systems shall provide long-term performance, resistance to moisture and corrosion, durability, energy efficiency, maintainability, and compatibility with a healthcare environment. Material transitions, façade systems, glazing, openings, exterior wall assemblies, architectural accents, and related envelope components shall be coordinated to create a cohesive institutional appearance while supporting the performance requirements of a critical healthcare facility.

The final design shall maintain the intent of a durable, resilient, and maintainable building envelope capable of supporting continuous hospital operations and minimizing maintenance requirements over the life of the facility. The Design-Build Entity shall verify hurricane resistance, wind-borne debris protection, seismic performance, water infiltration performance, air infiltration control, thermal performance, corrosion resistance, maintainability, and integration with structural, mechanical, electrical, fire protection, and life-safety systems.

All exterior envelope systems shall comply with applicable federal, Commonwealth of Puerto Rico, and local building codes, including all requirements related to hurricane design, wind loads, wind-borne debris regions, seismic design, flood or stormwater exposure where applicable, fire/life-safety performance, energy conservation, accessibility, healthcare occupancy, and all authority having jurisdiction requirements. The Design-Build Entity shall be responsible for final envelope engineering, detailing, testing, certification, product selection, permitting, and code compliance. Exterior envelope selections and systems that affect the approved architectural appearance, design intent, performance criteria, or life-cycle maintainability shall be coordinated with and submitted to the Owner for review in accordance with the Design-Build review process.

5.6.4 Public Spaces

The Design-Build Entity shall provide public areas that create a welcoming and easily understandable environment for patients, families, visitors, and community users. The main entrance lobby, waiting areas, auditorium, visitor support functions, meditation space, and administrative areas shall incorporate open and visually connected spaces that promote comfort and orientation.

Interior finishes within public areas shall utilize high-quality healthcare-grade materials, including terrazzo, ceramic tile, architectural ceiling systems, and durable wall protection elements that support appearance, infection prevention, cleanability, and long-term maintainability. Exterior terraces associated with public functions shall enhance the user experience by providing access to daylight and outdoor environments, subject to safety, security, infection-control, and operational requirements.

5.6.5 Clinical Spaces

The Design-Build Entity shall provide clinical environments characterized by simplicity, durability, maintainability, infection prevention, patient safety, and patient-centered design. Clinical spaces shall support efficient care delivery, staff visibility, patient privacy, accessibility, and the operational requirements of each department.

The extensive use of private patient rooms throughout the intensive care, telemetry, intermediate care, and rehabilitation units shall establish a consistent healing environment that promotes privacy, infection control, family participation in care, and patient dignity. Clinical planning shall support safe patient movement, clear staff access, equipment accommodation, required clearances, and coordination with medical gases, utilities, technology, and infection-control requirements.

5.6.6 Interior Finishes

The Design-Build Entity shall provide interior finish systems in accordance with the Advanced Architectural Design Development documents and Bridging Documents, appropriate for a high-acuity healthcare facility and consistent with the established finish intent. Interior finishes shall support infection prevention, cleaning efficiency, durability, accessibility, patient safety, long-term maintainability, and a consistent architectural character throughout the hospital.

Interior finish systems shall utilize healthcare-specific materials appropriate to the operational requirements of each department, including seamless resilient flooring, epoxy terrazzo, clean-room ceiling systems, washable wall surfaces, impact-resistant wall protection, and moisture-resistant gypsum board assemblies where required. Finish selections shall be coordinated with infection-control requirements, environmental services operations, life-safety requirements, accessibility standards, maintenance protocols, and the Owner's approved design intent.

5.6.7 Wayfinding

The Design-Build Entity shall maintain clear wayfinding based on the building's vertical organization, straightforward floor layouts, and repetitive public-space planning. Public destinations, patient care units, administrative functions, and support services shall be readily identifiable through architectural features, finish transitions, lighting, signage, spatial organization, and consistent visual cues throughout the hospital.

The ramp system shall be maintained as a significant architectural and wayfinding element within the public and visitor circulation strategy. Because the ramp extends through the hospital levels and is associated with visitor waiting areas and public spaces, it shall provide a consistent and recognizable spatial reference that assists users in understanding the building organization. The repetitive relationship between the ramp, waiting areas, public circulation, and vertical movement shall reinforce orientation, improve intuitive navigation, and support movement between levels.

The repetitive organization of inpatient nursing units, the logical arrangement of public circulation paths, and the consistent placement of public waiting areas shall facilitate intuitive navigation throughout the facility while supporting efficient movement of patients, visitors, staff, emergency personnel, and service operations. Final signage and wayfinding systems shall be coordinated with the Owner, accessibility requirements, language requirements, infection-control requirements, security, and life-safety criteria.

5.7 RESILIENCE AND PERFORMANCE REQUIREMENTS

5.7.1 Life Safety

The Trauma Hospital shall be designed as a critical healthcare facility that protects patients, staff, visitors, and emergency responders during both normal and emergency operations. The Design-Build Entity shall provide life-safety planning that includes protected vertical circulation, clearly defined egress routes, smoke and fire compartmentation, fire protection systems, fire alarm systems, emergency power coordination, and continuous access to critical patient care areas in accordance with applicable codes and healthcare standards.

The organization of the Emergency Department, Trauma Stabilization Unit, Operating Rooms, Imaging Services, Intensive Care Units, inpatient nursing units, and rooftop heliport shall support rapid patient movement while maintaining appropriate levels of safety, security, infection control, and operational control. The physical integration of the new hospital with the

existing ASEM Central Services Building shall support safe and efficient circulation between both facilities without compromising required fire/life-safety separations.

5.7.2 Disaster Preparedness

The Design-Build Entity shall provide a Trauma Hospital capable of supporting ASEM's role as Puerto Rico's primary trauma and emergency care institution during hurricanes, earthquakes, mass casualty incidents, public health emergencies, and other emergency events. The facility shall maintain essential trauma, surgical, imaging, critical care, inpatient, disaster management, and heliport operations during emergency conditions to the extent required by the Owner and applicable regulations.

The project shall include dedicated disaster-response functions, including emergency disaster accommodations, emergency management support spaces, and a Disaster Control and Monitoring Operations Center. The rooftop heliport and dedicated elevator connection shall provide direct access for aeromedical transport and emergency response operations.

The facility shall support emergency surge operations through a planned capacity of 110 proposed beds with the capability to accommodate an additional 72 surge beds when required, for a total potential capacity of approximately 182 beds. The Design-Build Entity shall verify all operational, life-safety, MEP, medical gas, staffing support, storage, infection-control, and licensing implications associated with surge operations.

5.7.3 Structural Resilience

Structural resilience shall be a fundamental design requirement of the Puerto Rico Trauma Hospital and an integral component of the overall architectural, operational, and life-safety concept of the facility. As a critical healthcare institution intended to provide essential trauma, emergency, surgical, intensive-care, diagnostic, support, and disaster-response services for Puerto Rico, the Hospital shall be designed and constructed not only to protect occupants during major seismic and wind events, but also to enhance the facility’s ability to remain safely occupiable, functional, and operational following such events.

Accordingly, the project establishes Immediate Occupancy / Continued Operational Performance as a principal resilience objective. This objective extends beyond the conventional code-level life-safety goal of preventing collapse and allowing safe evacuation. The design intent is to limit structural, architectural, nonstructural, equipment, utility, and building-system damage to the extent reasonably achievable so that the Hospital may remain safely occupied and may continue, or rapidly restore, its essential healthcare functions following a significant seismic event, subject to required post-event inspection, evaluation, and emergency operational protocols.

A fundamental component of this resilience strategy is the incorporation of a dedicated interstitial seismic-isolation level between the First and Second Levels of the Hospital. Architecturally, this interstitial space establishes a distinct separation plane between the Basement and First Level portions of the facility, which are directly associated with the ground and supporting site conditions, and the principal upper Hospital structure extending from the Second Level through the Ninth Level and the rooftop heliport.

Within this interstitial level, the structural isolation system shall create the seismic separation necessary for the upper Hospital structure to respond to earthquake-induced ground movement in a substantially controlled manner. The purpose of this strategy is to reduce the transmission of damaging seismic forces into the occupied upper portions of the Hospital and thereby contribute to the protection of critical clinical environments, circulation systems, architectural components, essential utilities, medical equipment, and other systems required for continued healthcare operations.

The interstitial isolation level shall therefore be understood not merely as a structural feature, but as an essential component of the Hospital's overall resilience and operational-continuity strategy. Its design and coordination shall recognize that the continued functionality of a critical healthcare facility depends on the collective performance of the building structure together with its architectural systems, partitions, ceilings, façades, vertical and horizontal circulation, mechanical and electrical services, plumbing and fire-protection systems, medical gases, communications, emergency systems, equipment, and other nonstructural components.

All building systems, services, utilities, architectural assemblies, and other components that interface with or cross the seismic-isolation plane shall be fully coordinated with the isolation strategy so that their configuration and installation do not compromise the intended movement, separation, resilience, or post-event functionality of the building. Particular attention shall be given to systems serving critical patient-care areas, emergency operations, life-safety functions, utility distribution, communications, medical equipment, and other services necessary for the Hospital to remain functional following a major seismic event.

The resilience strategy shall also support the continued availability, or prompt restoration, of the Hospital's principal operational functions, including emergency and trauma services, intensive-care services, surgical services, major utility systems, emergency power and support systems, disaster-response operations, and rooftop heliport functions. The design of the building and its systems shall recognize the importance of maintaining appropriate access, circulation, patient movement, staff operations, emergency-response capabilities, and logistical support during post-event conditions.

The Design-Build Entity shall preserve, further develop, coordinate, engineer, document, and construct the seismic-isolation and resilience concepts established by the Advanced Architectural Design Development and the Bridging Documents. The seismic isolation plane and the associated Immediate Occupancy / Continued Operational Performance objectives constitute fundamental elements of the Owner's design intent and shall not be eliminated, materially reduced, relocated, substituted, or otherwise modified without prior review and written acceptance by ASEM and coordination with the appropriate design professionals and Authorities Having Jurisdiction.

During development of the final design and Construction Documents, the Design-Build Entity, through its Architect and Engineers of Record, shall provide the complete multidisciplinary coordination necessary to translate this resilience objective into an integrated and constructible facility. Structural, architectural, mechanical, electrical, plumbing, fire-

protection, medical-gas, communications, equipment, and other building systems shall be developed collectively so that the performance of one discipline does not compromise the required performance of another or the intended post-event functionality of the Hospital as a whole.

The final design shall comply with all applicable codes and regulatory requirements while maintaining the higher project-specific resilience objectives established by the Bridging Documents. Compliance with minimum code requirements alone shall not be interpreted as authorization to diminish the seismic-isolation strategy, the Immediate Occupancy / Continued Operational Performance objective, or other resilience provisions specifically established for the Puerto Rico Trauma Hospital.

REFERENCE NOTE: For additional technical information regarding the structural resilience strategy, seismic-isolation system, design criteria, structural performance requirements, and related engineering considerations, refer to the Structural Design Narrative section of this Bridging Documents Report.

5.7.4 Sustainability Objectives

The Design-Build Entity shall promote long-term durability, efficient use of resources, and reduced operational impacts throughout the facility lifecycle. Sustainable design strategies shall focus on resilient building systems, durable healthcare materials, efficient energy and water use, reduced maintenance requirements, and reliable operation appropriate for a critical healthcare facility.

Site development shall incorporate environmental stewardship measures associated with the project, including responsible demolition practices, environmental mitigation activities, stormwater coordination, and implementation of required tree replacement and reforestation measures. Design decisions shall balance sustainability objectives with the reliability and performance requirements expected of a Level I Trauma Center.

5.7.5 Operational Continuity

The Trauma Hospital shall be planned and designed to maintain continuous operation during utility disruptions, natural disasters, maintenance activities, emergency events, and future facility modifications. The facility shall function as an integrated extension of the existing ASEM Central Services Building, expanding the trauma care capabilities of the Puerto Rico Medical Center while maintaining coordinated operations between both facilities.

Critical infrastructure shall support uninterrupted operation of trauma stabilization services, surgical services, imaging, intensive care, telemetry, rehabilitation, intermediate care, inpatient nursing units, disaster response functions, and aeromedical transport functions. Major electromechanical systems, emergency management facilities, operational support services, and utility infrastructure shall be organized to support reliability, maintainability, redundancy, and future adaptability.

The Design-Build Entity shall preserve these resilience and operational objectives while developing the final engineering, systems coordination, phasing, permitting, and construction solutions necessary for the long-term operation of the facility.

5.8 DESIGN COMPLIANCE REQUIREMENTS

5.8.1 Design Elements to Be Preserved

The Design-Build Entity shall preserve the spatial relationships, vertical distribution, major departmental organization, and fundamental planning intent established in the Advanced Architectural Design Development documents and the Bridging Documents, unless as specifically reviewed and accepted in writing by the Owner. The proposed Trauma Hospital shall remain integrated with the existing ASEM Central Services Building and shall continue to function as an extension of the Medical Center trauma services network.

The Design-Build Entity shall adhere to the Architectural Design Narrative, Structural Design Narrative, Mechanical Design Narrative, and Electrical Design Narrative included in the Bridging Documents. These narratives establish Owner requirements for structural resilience, seismic isolation, building systems performance, infrastructure, operational continuity, maintainability, and coordination with the Advanced Architectural Design Development documents. The Design-Build Entity shall coordinate the final architectural, structural, mechanical, electrical, plumbing, fire protection, medical gas, technology, and specialty systems design with these narratives and with the Owner throughout the Design-Build process.

The following design elements shall be preserved as essential Owner requirements:

- The clinical program, departmental organization, and functional relationships established by the Bridging Documents.
- The building location within the Puerto Rico Medical Center campus and its physical connection to the ASEM Central Services Building.
- The approved hospital capacity of 110 proposed beds with surge capacity for approximately 182 total beds.
- The ten-story hospital configuration, including basement services, clinical floors, administrative functions, disaster operations facilities, and rooftop heliport.
- The trauma-focused clinical model, including Emergency Department services, trauma stabilization, surgical services, intensive care, intermediate care, telemetry care, rehabilitation services, and disaster preparedness functions.
- The dedicated trauma heliport and associated emergency transport infrastructure, together with continued coordination of the existing ASEM Central Services Building helipad.
- The seismic isolation strategy incorporated between the first and second levels as part of the building resilience approach.
- The architectural character, material quality standards, patient-centered environment, and operational objectives established in the Bridging Documents.

- The required separation and coordination of public, patient, staff, emergency, service, clean, soiled, and restricted circulation flows.
- The structural resilience requirements, seismic isolation strategy, heliport structural loading requirements, mechanical and electrical system performance requirements, infrastructure coordination, and operational continuity requirements established in the Structural Design Narrative, Mechanical Design Narrative, and Electrical Design Narrative.

The Design-Build Entity shall submit any proposed change affecting these elements for Owner review and written acceptance prior to incorporation into the final design.

5.8.2 Allowable Design-Build Modifications

Allowable Design-Build modifications shall be limited to modifications required or proposed to improve constructability, operational efficiency, system performance, maintainability, sustainability, code compliance, permitting, life-cycle value, or interdisciplinary coordination, provided that the approved design intent and Owner requirements are preserved.

Allowable modifications may include the following and are subject to Owner review:

- Structural system optimization, provided such optimization is consistent with the Structural Design Narrative, approved resilience objectives, seismic isolation strategy, heliport loading requirements, applicable codes, and Owner requirements.
- Mechanical, electrical, plumbing, fire protection, medical gas, communications, security, and technology system development, provided such changes are consistent with the Mechanical Design Narrative, Electrical Design Narrative, Advanced Architectural Design Development documents, Bridging Documents, and Owner requirements, and are intended as enhancements or improvements and not as a fundamental alteration of the established design intent.
- Equipment selection and coordination consistent with the approved clinical program and operational requirements.
- Material substitutions of equal or superior quality, durability, cleanability, infection-control performance, and life-cycle value.
- Detailed space refinements required for code compliance, healthcare licensing, interdisciplinary coordination, accessibility, or equipment coordination.
- Building envelope, energy performance, sustainability, and resilience enhancements that maintain the established architectural character and performance requirements.

No modification shall reduce the approved clinical capacity, alter major departmental relationships, diminish resilience objectives, compromise operational continuity, adversely affect patient care functions, compromise heliport or helipad operations, reduce the architectural quality established by the Bridging Documents, or conflict with the Structural Design Narrative, Mechanical Design Narrative, or Electrical Design Narrative. However, the Owner has the right to reject any proposed modification that does not preserve the design intent or minimum project requirements.

5.9 PROJECT COMPLIANCE REQUIREMENTS

5.9.1 Applicable Codes and Standards

The Design-Build Entity shall be responsible for demonstrating full compliance with all, but not limited to, applicable federal, Commonwealth of Puerto Rico, local, industry, healthcare, aviation, environmental, accessibility, fire/life-safety, building code, and permitting requirements. The Design-Build Entity shall comply with all the latest legally applicable adopted codes and standards at the time of permit submission and shall comply with any more stringent requirement imposed by authorities having jurisdiction.

Compliance verification with Owner (ASEM) shall include, at a minimum:

- Design compliance matrices.
- Code analysis reports.
- Regulatory compliance documentation.
- Quality control and interdisciplinary coordination reviews.
- Agency approvals, permits, certifications, endorsements, determinations, and required clearances.
- Documentation of all approved design deviations.
- Written confirmation of compliance with preserved Owner requirements established in the Bridging Documents.

The final design and construction documents shall comply with all applicable requirements, including but not limited to the following, as applicable to the Project:

5.9.1.1 Federal Requirements

- Americans with Disabilities Act (ADA).
- 2010 ADA Standards for Accessible Design.
- Occupational Safety and Health Administration (OSHA) requirements.
- HIPAA requirements affecting healthcare facility planning, privacy, security, and operations.
- Federal Emergency Management Agency (FEMA) guidance and requirements applicable to critical facilities and federally funded work.
- Applicable Centers for Medicare & Medicaid Services (CMS) requirements.
- 24 CFR Part 58 Environmental Review Procedures.
- Applicable environmental requirements under NEPA and related federal regulations.
- FAA requirements applicable to the existing ASEM Central Services Building helipad and the proposed rooftop trauma heliport. FAA heliport design and notice requirements, including FAA AC 150/5390-2D and FAA Form 7480-1 / Part 157 notice coordination.

5.9.1.2 Building Codes and Life Safety Standards

- Puerto Rico Building Code and the referenced International Building Code (IBC), as legally adopted and applicable.
- International Existing Building Code (IEBC), where applicable.

- International Fire Code (IFC).
- International Mechanical Code (IMC).
- International Plumbing Code (IPC).
- International Fuel Gas Code (IFGC), where applicable.
- International Energy Conservation Code (IECC).
- NFPA 101 Life Safety Code.
- NFPA 99 Health Care Facilities Code.
- NFPA 70 National Electrical Code.
- NFPA 110 Emergency and Standby Power Systems.
- NFPA 13 Automatic Sprinkler Systems.
- NFPA 14 Standpipe Systems.
- NFPA 20 Fire Pumps.
- NFPA 72 Fire Alarm and Signaling Systems.
- NFPA 241 Safeguarding Construction, Alteration, and Demolition Operations.

5.9.1.3 Healthcare Planning and Design Standards

- FGI Guidelines for Design and Construction of Hospitals, as applicable to the Project and as required by the Owner and authorities having jurisdiction.
- Applicable Joint Commission standards.
- Applicable CMS Conditions of Participation.
- Applicable Puerto Rico Department of Health licensing requirements.
- Evidence-based healthcare design principles where applicable to patient safety, infection prevention, clinical workflow, and staff effectiveness.

5.9.1.4 Puerto Rico Requirements

- Puerto Rico Building Code, latest legally adopted edition applicable to the Project.
- Puerto Rico Fire Code and Puerto Rico Fire Marshal requirements.
- Puerto Rico Joint Permits Regulation (Reglamento Conjunto 2023).
- OGPe permitting requirements.
- Puerto Rico Department of Health licensing and healthcare facility requirements.
- Puerto Rico environmental agency requirements and successor agency requirements, as applicable.
- Puerto Rico Medical Emergency and Disaster Management requirements, as applicable.
- Puerto Rico Ports Authority, aviation, utility, municipal, and other agency requirements applicable to the Project.
- Puerto Rico Department of Transportation and Public Works - Uniform General Conditions for Public Works Contracts in Puerto Rico

The Design-Build Entity shall be solely responsible for verifying all applicable codes, regulations, standards, agency requirements, permits, certifications, inspections, endorsements, clearances, determinations, approvals, and authorizations necessary for the final design, construction, occupancy, licensing, and operation of the Puerto Rico Trauma Hospital.

5.9.2 24 CFR Part 58 Environmental Review and Section 106 Compliance

ASEM, as the proposing project entity and the party responsible for administration of the Project's environmental compliance process, shall retain responsibility for directing, coordinating, completing, maintaining, and, as applicable, obtaining the required environmental determinations, findings, consultations, clearances, and related documentation under 24 CFR Part 58. This responsibility includes the Project's Environmental Assessment Determination and Compliance Findings and the Section 106 National Historic Preservation Act (NHPA) Effect Determination, together with associated consultation and compliance documentation. Nothing in the Bridging Documents shall be construed as transferring ASEM's responsibility for making, approving, or certifying such environmental determinations to the Design-Build Entity.

The Design-Build Entity, including its Architect and Engineer(s) of Record, contractors, subcontractors, consultants, and delegated-design participants, shall fully comply, cooperate, and coordinate with ASEM and its authorized environmental, historic-preservation, archaeological, regulatory, and technical representatives in the continued implementation of the Project's 24 CFR Part 58 environmental requirements. The Design-Build Entity shall promptly provide the drawings, technical descriptions, calculations, studies, schedules, construction sequencing, site-disturbance limits, demolition information, excavation limits, utility work, temporary construction activities, access and staging plans, equipment and crane information, and other Project data reasonably requested by ASEM to support, confirm, update, or document environmental compliance.

The Design-Build Entity shall review and incorporate into the final design, construction documents, specifications, procurement packages, construction schedule, subcontracts, means and methods, and field operations all applicable mitigation measures, avoidance or minimization commitments, monitoring requirements, environmental conditions, archaeological and cultural-resource protection measures, agency consultation requirements, permit conditions, and other commitments established by ASEM through the Environmental Assessment, Environmental Review Record, Section 106 process, agency consultations, environmental determinations, or subsequent written instructions. Such requirements shall be treated as mandatory Project requirements unless ASEM provides written direction otherwise.

The Design-Build Entity shall not implement any material change in Project scope, building configuration, site limits, demolition, excavation, utility work, temporary construction, access, staging, construction sequencing, equipment location, or means and methods that could affect the basis of an environmental determination or consultation without first notifying ASEM and providing sufficient information for ASEM to determine whether additional environmental review, reevaluation, consultation, documentation, mitigation, or agency coordination is required. The Design-Build Entity shall not assume that an existing environmental determination remains applicable to a materially revised condition without ASEM's written direction.

The Design-Build Entity shall comply with all environmental-review sequencing requirements, construction hold points, notices, restrictions, conditions precedent, and written directions

established by ASEM to preserve compliance with 24 CFR Part 58 and related federal environmental authorities. No activity identified by ASEM as subject to a pending environmental review requirement, consultation, clearance, mitigation prerequisite, or other environmental condition shall proceed until ASEM provides written authorization to proceed.

For Section 106 NHPA compliance, the Design-Build Entity shall implement all avoidance, protection, monitoring, documentation, and discovery procedures established by ASEM. If archaeological materials, human remains, previously unidentified cultural resources, or conditions potentially affecting historic properties are encountered during demolition, excavation, or construction, the Design-Build Entity shall immediately stop work within the affected area, protect the discovery from further disturbance, notify ASEM, and proceed only in accordance with ASEM's instructions and the applicable approved consultation or discovery protocol. The Design-Build Entity shall not independently make or modify any Section 106 effect determination on behalf of ASEM.

The Design-Build Entity shall maintain complete records demonstrating its implementation of applicable environmental requirements, mitigation measures, monitoring activities, communications, field observations, corrective actions, and required closeout documentation, and provide such records to ASEM when requested for inclusion in or support of the Project's Environmental Review Record and other compliance files.

ASEM's responsibility for the 24 CFR Part 58 environmental review and the identified environmental and Section 106 determinations shall not relieve the Design-Build Entity of its independent responsibility for compliance with environmental laws, permits, construction practices, pollution-prevention requirements, waste-management requirements, protection measures, and other regulatory obligations applicable to its final design and construction work. The Design-Build Entity shall remain responsible for executing the Project in a manner consistent with all environmental requirements and conditions communicated or approved by ASEM.

5.9.3 Puerto Rico Government Agency Recommendations, Endorsements, Approvals, and Permitting Responsibilities

In addition to the federal compliance obligations identified elsewhere in the Bridging Documents, the Design-Build Entity shall be responsible for identifying, preparing, coordinating, filing, pursuing, obtaining, maintaining, renewing, amending, closing out, and providing to ASEM all recommendations, endorsements, consultations, determinations, approvals, permits, certificates, inspections, clearances, authorizations, and related regulatory documentation required by the Government of Puerto Rico, applicable municipalities, public corporations, utilities, and other authorities having jurisdiction for the final design, construction, commissioning, occupancy, and lawful use of the Puerto Rico Trauma Hospital. Such responsibility shall include all submissions, supporting studies, drawings, calculations, certifications, professional seals, application forms, responses to agency comments, meetings, inspections, fees, resubmissions, permit modifications, and follow-up actions required to obtain and maintain the applicable approvals through

completion of the Project, except for fees or actions expressly assigned otherwise in the final Design-Build Agreement.

5.9.3.1 Agency Recommendations, Endorsements, Consultations, and Preconstruction Approvals.

The Design-Build Entity shall request and obtain all recommendations, endorsements, consultations, clearances, determinations, and approvals required before or in support of construction permitting. Agencies and entities shall include, without limitation and as applicable to the Project, the Puerto Rico Office of Permit Management (OGPe) and/or the applicable Autonomous Municipality, the Puerto Rico Department of Health, the Puerto Rico Department of Natural and Environmental Resources (DNER) and other environmental authorities, the Institute of Puerto Rican Culture and applicable historic-preservation authorities, the Puerto Rico Fire Bureau, LUMA Energy, the Puerto Rico Aqueduct and Sewer Authority (AAA), telecommunications service providers and regulatory authorities, transportation and roadway authorities, the Puerto Rico Ports Authority and aviation authorities where applicable, and any other Commonwealth, municipal, public utility, public corporation, or authority having jurisdiction. The Design-Build Entity shall incorporate all conditions, restrictions, technical requirements, mitigation measures, agency comments, and approval criteria resulting from such processes into the final design and construction documents and the execution of the Work.

5.9.3.2 Building Construction and Related Permits.

The Design-Build Entity shall request, obtain, and maintain in full force all permits and authorizations required to commence, prosecute, and complete construction of the Project. This responsibility shall include, without limitation and as applicable, the applicable consolidated or individual construction permits, demolition permits, excavation and earthwork permits, grading and site-development permits, environmental permits, utility permits and service authorizations, electrical and plumbing permits, fire-protection reviews and approvals, roadway or access permits, temporary construction permits, certificates and inspections, and all other construction-related permits required by OGPe, an Autonomous Municipality, the Puerto Rico Department of Health, the Puerto Rico Department of Natural and Environmental Resources (DNER), other environmental authorities, historic-preservation authorities, LUMA Energy, AAA, the Puerto Rico Fire Bureau, telecommunications entities, and other authorities having jurisdiction. No portion of the Work shall commence before the Design-Build Entity has obtained the permits, endorsements, approvals, and authorizations legally required for that portion of the Work and has furnished current copies to ASEM.

5.9.3.3 Use, Occupancy, and Final Project Approvals

As a condition of Project closeout and prior to occupancy or use of the completed facilities, the Design-Build Entity shall request, coordinate, obtain, and deliver to ASEM all building use, occupancy, final acceptance, operational-readiness, and related permits, certificates, endorsements, inspections, and approvals required for the lawful use of the completed Project. These shall include, without limitation and as applicable, the applicable Use Permit and/or Unified Permit, final construction and occupancy approvals, Puerto Rico Department of

Health facility and physical-plant approvals and inspections, fire and life-safety approvals, environmental closeout approvals and authorizations from the Puerto Rico Department of Natural and Environmental Resources (DNER) and other applicable environmental authorities, historic-preservation closeout requirements, utility acceptance and permanent-service authorizations from LUMA Energy and AAA, telecommunications service approvals, and any other final certifications or authorizations required by the applicable governmental agencies, utilities, municipalities, or authorities having jurisdiction. Where a license, permit, certification, filing, or authorization is legally required to be issued to, executed by, or maintained in the name of ASEM or the ultimate healthcare operator, the Design-Build Entity shall timely prepare and coordinate all required technical documentation, certifications, inspections, and supporting information and shall fully assist ASEM in obtaining such approval.

5.9.3.4 Permitting Matrix, Schedule, and Regulatory Coordination.

The Design-Build Entity shall develop and maintain a comprehensive permitting and agency-approval matrix identifying each required recommendation, endorsement, consultation, permit, approval, inspection, certificate, responsible agency, responsible Design-Build team member, required predecessor action, anticipated submission date, agency review period, expiration or renewal date, conditions of approval, and final status. The permitting schedule shall be fully integrated into the Project design and construction schedule and shall provide sufficient time for agency review, comments, revisions, resubmissions, inspections, testing, and final approvals. The Design-Build Entity shall proactively coordinate with the applicable agencies and shall not rely upon agency review periods or incomplete submissions as a basis for proceeding with unpermitted Work.

5.9.3.5 Design Revisions and Permit Modifications.

Any change, substitution, value-engineering proposal, delegated-design item, means-and-methods decision, field condition, or other revision that affects an agency recommendation, endorsement, approval, permit, or previously accepted submission shall be promptly evaluated by the Design-Build Entity. The Design-Build Entity shall prepare and obtain all required amended submissions, permit revisions, supplemental endorsements, reapprovals, and agency confirmations before implementing the affected Work.

5.9.3.6 Documentation and Closeout.

The Design-Build Entity shall maintain a complete and current regulatory record for the Project and shall provide ASEM with copies of all applications, transmittals, agency correspondence, meeting records, comments, responses, permits, approvals, endorsements, inspection reports, certificates, notices, renewals, amendments, and final closeout documents. Required final permits, certificates, approvals, and agency acceptances applicable to the completed Work shall constitute part of the Project closeout documentation and shall be obtained before Substantial Completion, Final Completion, occupancy, or operation, as applicable to the particular approval and as required by the final Design-Build Agreement.

5.9.3.7 Owner Participation and Preservation of ASEM Environmental Responsibilities.

ASEM shall provide Owner signatures, authorizations, property information, or other Owner-specific participation only where legally required or otherwise established by the final Design-Build Agreement. Such participation shall not relieve the Design-Build Entity from responsibility for preparing complete and timely submissions, managing the permitting process, responding to agency requirements, and obtaining the approvals assigned to the Design-Build Entity. Nothing in this subsection shall transfer to the Design-Build Entity ASEM's separate responsibility for the federal environmental review process, Environmental Assessment Determination and Compliance Findings, or Section 106 NHPA Effect Determination under 24 CFR Part 58; however, the Design-Build Entity remains responsible for obtaining and complying with all Puerto Rico and local environmental permits, construction approvals, mitigation requirements, and agency conditions applicable to its final design and construction activities.

5.9.4 Project Investigations, Studies, Surveys, Testing, and Technical Reports

5.9.4.1 General Responsibility.

The Design-Build Entity shall be responsible for identifying, commissioning, contracting, coordinating, performing, updating, and obtaining all investigations, surveys, field explorations, testing, analyses, engineering evaluations, technical studies, calculations, and reports necessary to verify existing conditions; establish final design criteria; prepare complete, coordinated, and code-compliant construction documents; obtain required permits and approvals; develop safe and appropriate construction means and methods; and construct, test, commission, and complete the Puerto Rico Trauma Hospital. Unless expressly assigned otherwise in the final Design-Build Agreement, such services shall be included within the Design-Build Entity's scope and shall be performed at its cost by qualified, appropriately licensed or certified professionals having demonstrated experience in the applicable specialty.

5.9.4.2 Minimum Required Investigations.

The Design-Build Entity shall determine the full extent and frequency of investigations required by the final design, applicable codes, authorities having jurisdiction, site conditions, construction methods, and good professional practice. The required scope shall include, without limitation and as applicable, the following categories, together with any supplemental studies necessary to address conditions identified during design or construction.

5.9.4.3 Geotechnical, Subsoil, and Foundation Studies.

Perform a project-specific geotechnical investigation, including sufficient borings, sampling, laboratory testing, field testing, groundwater observations, and engineering analysis to establish subsurface stratigraphy and engineering properties and to support the final design of foundations, slabs, retaining systems, excavation, earthwork, fill, pavements, underground structures, and related work. The geotechnical report shall address, as applicable, allowable bearing capacities, settlement, lateral earth pressures, excavation stability, temporary and permanent support-of-excavation considerations, soil improvement, compaction and fill requirements, corrosivity or other soil characteristics affecting materials, and recommendations required for safe design and construction.

5.9.4.4 Groundwater, Water-Table, Excavation, and Dewatering Studies.

Investigate and document groundwater and water-table conditions affecting the basement, foundations, underground utilities, excavation, waterproofing, buoyancy resistance, and construction operations. The Design-Build Entity shall develop, through qualified professionals, the required groundwater-control and dewatering analyses and reports, including anticipated pumping requirements, temporary and permanent groundwater-control measures, discharge locations and treatment requirements, applicable permits, monitoring requirements, and evaluation of potential effects on adjacent buildings, utilities, pavements, foundations, and other facilities. Seasonal or variable groundwater conditions shall be considered where relevant to the Project.

5.9.4.5 Hydrologic, Hydraulic, Stormwater, and Drainage Studies.

Perform all hydrologic and hydraulic studies required to establish the final site drainage and stormwater-management design. Such analyses shall address, as applicable, existing and proposed drainage patterns, design rainfall, runoff, storm-sewer and conveyance capacity, inlet and piping sizing, detention or retention requirements, overflow and emergency drainage paths, erosion and sediment-control criteria, flood conditions, downstream impacts, and the capacity and acceptability of proposed points of discharge. The final design shall incorporate all recommendations, mitigation measures, agency criteria, and permitting requirements resulting from these studies.

5.9.4.6 Seismic, Geologic, and Geohazard Evaluations.

Perform the evaluations required to establish project-specific seismic and geologic design criteria and to confirm the suitability of the site and subsurface conditions for the proposed hospital. As applicable, the studies shall address site classification, seismic design parameters, liquefaction potential, differential settlement, slope or excavation stability, soil-structure interaction, ground-improvement needs, and other geologic or seismic hazards affecting the final structural, architectural, civil, and utility design. Findings shall be coordinated with the Architect and Engineer(s) of Record and incorporated into the final construction documents.

5.9.4.7 Existing-Conditions, Survey, and Utility Investigations.

Obtain and maintain the certified boundary, topographic, elevation, control, and existing-conditions surveys required for final design and construction. The Design-Build Entity shall independently verify the horizontal and vertical location, size, depth, invert elevation, material, condition, capacity, ownership, operational status, and disposition of existing utilities and infrastructure that may affect the Work. Verification methods shall include record research, field survey, utility locating, test pits, potholing, subsurface utility engineering, ground-penetrating radar, CCTV inspection, flow testing, or other appropriate methods where required. The Design-Build Entity shall not rely solely upon approximate utility information, existing drawings, or information contained in the Bridging Documents when field verification is necessary for final design or construction.

5.9.4.8 Utility Capacity and Points-of-Connection Studies.

Coordinate with ASEM and the applicable utility and service providers to verify and document the location, elevation, configuration, available capacity, pressure, voltage, fault-current or other service characteristics, metering requirements, connection requirements, and approved points of connection for all required permanent and temporary services. This responsibility shall include, as applicable, potable and fire-protection water, sanitary sewer, storm drainage, electrical service, emergency or alternate power interfaces, telecommunications and data, fuel systems, medical or specialty utility interfaces, and other Project services. The Design-Build Entity shall obtain the technical confirmations, capacity evaluations, service studies, utility-company requirements, and written coordination necessary to support the final design and permitting, including coordination with LUMA Energy, the Puerto Rico Aqueduct and Sewer Authority (AAA), telecommunications providers, ASEM utility personnel, and other service entities having jurisdiction.

5.9.4.9 Adjacent-Structure and Construction-Impact Studies.

Where excavation, dewatering, demolition, vibration-producing work, crane operations, temporary works, utility interruptions, or other construction activities could affect adjacent ASEM facilities, hospitals, roadways, utilities, or structures, the Design-Build Entity shall perform the preconstruction surveys, structural evaluations, support-of-excavation analyses, underpinning studies, settlement or movement analyses, vibration assessments, monitoring plans, and other construction-impact studies necessary to protect existing facilities and maintain their required operations. Monitoring thresholds, instrumentation, reporting, corrective-action procedures, and emergency response requirements shall be established when appropriate to the identified risk.

5.9.4.10 Additional Discipline-Specific Studies and Reports.

The Design-Build Entity shall obtain any other studies, tests, surveys, evaluations, and reports reasonably required for a complete final design and lawful construction of the Project, including, as applicable, environmental or hazardous-material investigations related to construction activities, traffic and access studies, pavement evaluations, fire-flow and water-supply testing, utility load and capacity studies, electrical short-circuit, coordination and arc-flash studies, acoustical and vibration studies, building-envelope or waterproofing evaluations, constructability investigations, demolition and material-characterization studies, temporary-works engineering, crane and heavy-lift studies, and any other specialized technical analysis required by the Project conditions, the Owner, the applicable codes, the permitting agencies, or authorities having jurisdiction.

5.9.4.11 Coordination, Reliance, and Incorporation into the Work.

All investigations and technical reports shall be coordinated among the Design-Build Entity's Architect and Engineer(s) of Record, specialty consultants, contractors, subcontractors, delegated-design professionals, and affected agencies and utility providers. Findings and recommendations shall be reconciled across disciplines and incorporated into the final calculations, construction documents, specifications, permitting submissions, construction sequencing, temporary works, means and methods, quality-control procedures, and field

execution. Conflicts, discrepancies, or material differences between field-verified conditions and the Bridging Documents shall be promptly brought to ASEM's attention and shall be resolved through the Design-Build Entity's final design and coordination process before the affected Work proceeds.

5.9.4.12 Owner-Provided Information and Bridging Documents.

Any existing studies, surveys, reports, drawings, utility information, geotechnical data, environmental information, or other reference material furnished by ASEM or included in the Bridging Documents is provided for purpose and subject to the limitations stated in the applicable Bridging Documents. Unless expressly stated otherwise in the final Design-Build Agreement, the availability of such information shall not relieve the Design-Build Entity from determining whether additional investigation, verification, testing, analysis, or updated reports are required for its final design, permitting, construction documents, construction means and methods, or completed Work.

5.9.4.13 Environmental Review Coordination.

If any investigation, field exploration, testing program, study finding, proposed mitigation measure, or resulting design or construction change could affect the basis of ASEM's Environmental Assessment Determination and Compliance Findings, Section 106 NHPA Effect Determination, Environmental Review Record, or other requirement administered by ASEM under 24 CFR Part 58, the Design-Build Entity shall promptly provide the relevant information to ASEM and shall comply with ASEM's written direction before undertaking the affected activity. Nothing in this subsection transfers ASEM's federal environmental-review determination responsibilities to the Design-Build Entity; however, the Design-Build Entity remains responsible for commissioning and performing the technical investigations required for its design and construction responsibilities and for complying with the environmental conditions applicable to such activities.

5.9.4.14 Study Schedule, Deliverables, and Record Documents.

The Design-Build Entity shall identify required studies and investigations early enough to avoid delays to design, permitting, procurement, and construction and shall integrate them into the Project schedule. Final reports and supporting data shall be signed and sealed or certified when required by law or professional practice and shall be submitted to ASEM as part of the applicable design, permitting, construction, and closeout documentation. Where field conditions or construction observations demonstrate that an earlier investigation is incomplete or no longer representative, the Design-Build Entity shall perform the supplemental investigation and update the affected design and construction documents accordingly.

5.9.5 FAA Heliport Notices, Determinations, Permits, and Approvals

The Design-Build Entity shall be responsible for identifying, preparing, filing, coordinating, obtaining, and maintaining all required FAA notices, determinations, approvals, authorizations, permits, and related documentation applicable to both the existing ASEM Central Services Building helipad and the proposed new hospital heliport. This responsibility shall include, without limitation, all FAA airspace reviews, heliport design reviews, construction or alteration

notices, activation or modification filings, deactivation or temporary operational filings if applicable, and coordination required under applicable FAA regulations, advisory circulars, forms, and procedures.

The proposed new hospital heliport shall be designed, as required by the Owner, to support the safe operation of helicopters with operational and design requirements up to and including the Sikorsky S-92 (Including the military VH-92A Patriot version) presidential helicopter, or the controlling design aircraft criteria identified by the Owner, FAA, and applicable authorities. This helicopter capacity requirement shall be treated as an Owner requirement and shall be incorporated into the final heliport design, structural design, permitting documents, FAA coordination, and construction documents. The Design-Build Entity shall verify and provide the required dimensional criteria, structural capacity, load capacity, approach and departure clearances, safety areas, rotor clearances, operational clearances, lighting, marking, signage, fire/life-safety coordination, and patient transfer requirements necessary to accommodate the required aircraft criteria.

The Design-Build Entity shall verify the regulatory status, operational status, approach and departure surfaces, obstruction conditions, lighting, marking, signage, safety areas, dimensional criteria, structural criteria, aircraft design criteria, and operational requirements of the existing helipad and the proposed new heliport. No condition created by the final design or construction activities shall compromise the safe and compliant use of the existing helipad or the future operation of the new heliport.

The Design-Build Entity shall coordinate all heliport-related submissions with ASEM, helicopter operators, emergency medical transport stakeholders, the FAA, OGPe, the Puerto Rico Ports Authority or other applicable aviation authorities, and all authorities having jurisdiction, as required. The Design-Build Entity shall incorporate all FAA determinations, conditions, recommendations, clearances, operational restrictions, obstruction mitigation requirements, and authority comments into the final design and construction documents.

The Design-Build Entity shall not commence any construction, alteration, temporary obstruction, rooftop equipment installation, crane operation, or related construction activity that could affect the existing helipad, the proposed new heliport, approach/departure paths, or navigable airspace without obtaining all required FAA submissions, reviews, determinations, approvals, authorizations, and Owner acceptance. The Design-Build Entity shall maintain documentation of all heliport-related coordination and shall provide copies to the Owner as part of each applicable design and permitting submission.

5.9.6 ASEM Puerto Rico Medical Center Operational Emergency and Disaster Management Response Program Requirements

5.9.6.1 General Responsibility and Owner Coordination.

During the Design-Build process for the final development, design, permitting, procurement, construction, testing, commissioning, and turnover of the Puerto Rico Trauma Hospital, the Design-Build Entity shall affirmatively request from ASEM all additional Owner operational, continuity-of-operations, emergency-preparedness, disaster-response, resilience,

redundancy, recovery, and related requirements that ASEM determines are necessary for integration of the Project with the Puerto Rico Medical Center Operational Emergency and Disaster Management Response Program. Such requirements shall address, as applicable, hurricanes, earthquakes, pandemics, extended utility or infrastructure outages, and other emergency or disaster conditions defined or recognized by applicable governmental authorities or identified by ASEM for operational planning purposes.

5.9.6.2 Relationship to Codes, Regulations, and Bridging Documents.

The Design-Build Entity shall recognize that requirements established by ASEM for its Operational Emergency and Disaster Management Response Program may be in addition to, and more stringent than, the minimum provisions required by applicable building codes, healthcare regulations, licensing requirements, emergency-management regulations, standards, and design guidelines, and may also be in addition to the systems, capacities, services, provisions, and features represented or contemplated in the Advanced Architectural Design Development and other Bridging Documents. Compliance with the applicable codes, regulations, guidelines, or Bridging Documents alone shall not relieve the Design-Build Entity from the obligation to obtain, coordinate, and implement ASEM's Project-specific emergency and disaster response requirements. The Design-Build Entity shall not independently establish or modify ASEM operational policy, but shall obtain ASEM's direction and translate such direction into coordinated design and construction requirements.

5.9.6.3 Formal Request, Confirmation, and Requirements Matrix.

At the earliest appropriate stage of the Design-Build process, and sufficiently in advance of finalizing system capacities, equipment selections, space allocations, procurement packages, or construction activities that could be affected, the Design-Build Entity shall submit a formal written request to ASEM identifying the emergency and disaster response criteria, provisions, services, features, operational scenarios, and infrastructure requirements requiring Owner confirmation. The Design-Build Entity shall participate in workshops, coordination meetings, technical reviews, and operational-planning discussions requested by ASEM and shall maintain a current requirements matrix identifying each ASEM-directed requirement, the affected discipline, system, space, or Project component, the proposed design response, required supporting calculations or studies, submittal status, ASEM comments or acceptance, and applicable testing, commissioning, or turnover requirement. These requirements shall be reconfirmed with ASEM at appropriate design milestones and before procurement or construction makes an affected element impracticable to modify.

5.9.6.4 Scope of ASEM-Directed Emergency and Disaster Response Provisions.

Without limiting ASEM's authority to identify the requirements applicable to the Project, the Design-Build Entity shall coordinate and incorporate, as directed by ASEM, additional provisions affecting any component of the building, site, infrastructure, or hospital systems. These may include, without limitation, emergency and service access; ambulance, staff, patient, supply, and logistics circulation; protected or controlled access points; staging and temporary operating areas; architectural and structural resilience or protection measures; emergency electrical generation and distribution; fuel storage, fuel-transfer, refueling, load-

management, temporary-power, quick-connect, and uninterruptible-power provisions; mechanical-system redundancy, emergency ventilation, isolation, cooling, and environmental-control provisions; potable-water and fire-protection storage and distribution; sanitary and stormwater systems; temporary and redundant utility connections; medical-gas systems; telecommunications, data, radio, public-address, security, fire-alarm, and emergency communication systems; emergency command, operational support, storage, and surge-support provisions; and any other building, equipment, utility, access, site, or infrastructure feature ASEM determines is required for the Puerto Rico Medical Center emergency and disaster response program.

5.9.6.5 Design Integration and Interdisciplinary Coordination.

The Design-Build Entity, through its Architect and Engineer(s) of Record and all applicable specialty consultants, contractors, subcontractors, equipment vendors, and delegated-design professionals, shall fully integrate the ASEM-directed emergency and disaster response requirements into the final architectural, structural, civil, mechanical, electrical, plumbing, fire-protection, medical-gas, telecommunications, security, site, utility, and specialty-system designs. Required capacities, redundancies, spatial provisions, equipment, controls, interfaces, connection points, access requirements, details, specifications, schedules, and operational sequences shall be reflected consistently in the final construction documents and procurement packages. Any conflict between an ASEM-directed requirement and the Bridging Documents, applicable code, final design criteria, or another Project requirement shall be promptly brought to ASEM's attention and resolved through a documented, code-compliant interdisciplinary coordination process before the affected work is finalized or constructed.

5.9.6.6 Construction-Period Emergency Operations and Continuity.

The Design-Build Entity shall plan and execute construction so that Project activities do not unnecessarily impair the existing Puerto Rico Medical Center's ability to implement its emergency and disaster response procedures. Construction staging, temporary barriers, site access, road or ambulance-route modifications, shutdowns, utility interruptions, crane operations, temporary facilities, deliveries, demolition, excavation, and other activities that could affect emergency access, life-safety systems, critical utilities, communications, or the operation of adjacent ASEM facilities shall be coordinated in advance with ASEM. When an emergency or disaster condition is declared or activated during construction, the Design-Build Entity shall comply with applicable governmental requirements and ASEM instructions affecting access, site control, work sequencing, shutdowns, temporary services, protection measures, personnel coordination, or suspension and resumption of affected construction activities.

5.9.6.7 Testing, Commissioning, Training, and Turnover.

All systems, services, equipment, interfaces, and special provisions incorporated in response to ASEM's Operational Emergency and Disaster Management Response Program shall be inspected, tested, demonstrated, commissioned, and documented as applicable to verify the intended emergency operating capability. The Design-Build Entity shall coordinate integrated testing of affected systems and operational sequences and shall provide ASEM, as required,

with final as-built documentation, operating and maintenance information, emergency operating sequences, system-control narratives, testing and commissioning records, training, and other turnover materials necessary for ASEM to understand, operate, maintain, and activate the completed provisions as part of its emergency and disaster management program.

5.9.6.8 Continuing Coordination and Contract Administration.

The Design-Build Entity shall maintain continuing coordination with ASEM throughout final design and construction to identify revisions or additions to the Project-specific emergency and disaster response requirements. The Design-Build Entity shall not assume that the absence of a specific emergency-management feature from the Bridging Documents means that no additional ASEM requirement applies. Any ASEM direction that modifies established contractual scope, price, or schedule shall be identified and administered in accordance with the final Design-Build Agreement; however, the Design-Build Entity's obligation to timely request, identify, coordinate, document, and evaluate the applicable ASEM requirements shall remain part of its Design-Build responsibilities. No substitution, value-engineering proposal, design modification, or construction change shall reduce or eliminate an ASEM-directed emergency or disaster response capability without ASEM's prior written acceptance.

5.10 SPACE PROGRAM SUMMARY

5.10.1 Summary Introduction

The following Space Program Summary establishes the approved programmatic basis for the development of the Bridging Documents for the Puerto Rico Trauma Hospital and shall serve as the minimum Owner requirement. The Design-Build Entity is responsible for verifying and confirming all programmatic elements, including departmental areas, proposed bed counts, surge capacity, room quantities, operational needs, and regulatory requirements—with ASEM during final design development.

The proposed Puerto Rico Trauma Hospital comprises approximately 215,880 gross square feet distributed across ten levels and a rooftop helipad. The facility is planned with a proposed capacity of 110 beds and surge capacity for an additional 72 beds, for a total potential capacity of 182 beds. It is designed as a dedicated Level I Trauma Hospital and will be functionally integrated with the existing ASEM Central Services Building.

This Program Summary defines the required clinical departments, major functional components, patient care units, support services, and operational functions to be incorporated into the Project. The Design-Build Entity shall use this approved framework as the basis for design and shall incorporate any necessary refinements to meet operational, regulatory, and licensing requirements. No reduction, elimination, relocation, or material modification of the approved programmatic requirements, departmental functions, proposed bed capacities, or emergency surge capacity shall be made without prior written approval from ASEM.

5.10.2 Space Program per Level

Basement Level – 36,780 SF

Electro-Mechanical Area

- Main electromechanical utility services
- Central building support systems

Administrative and Operational Support

- Nursing Department – Educational / Training area
- Facilities Manager
- Physical Plant
- ASEM Emergency Disaster Control Center Sleeping Quarters

Support Services

- Main general storage
- Cafeteria services
- Staff support area
- MD's support area
- Patient Transport
- General Respiratory Therapy

First Level – 41,050 SF

Trauma Hospital Main Entrance

- Main Lobby
- Entrance and reception
- Visitor's support and waiting areas

ASEM Emergency Department Entrance

- Public entrance and reception
- Registration
- Support and waiting areas
- 2 Triage services
- Fast track patient care and support areas
- Emergency Department support functions
- Concession retail space

ASEM Central Services Building Visitor's Entrance

- Main Lobby
- Entrance and reception
- Visitor's support and waiting areas

Ambulance Entrance and Closed Parking Yard

- Ambulance Entrance
- 7 Ambulance patient drop-off

- 4 Ambulance Triage
- Decontamination
- Security Control
- Communications and Control Center
- Ambulance exit and Service Parking

Trauma Stabilization and Observation Unit

- 8 Stabilization cubicles
- 8 Observation cubicles
- 1 isolation room
- Support areas

Trauma Surgical Services

- 5 Operating Rooms
- Pre-operative services
- Post-anesthesia recovery services
- Support areas

Imaging Services

- Computed Tomography (CT)
- Diagnostic Radiology (X-Ray)
- Support areas

Trauma Intensive Care Unit

- 10 private ICU rooms
- Support areas

ASEM Surveillance Headquarters

- P.R. Police office
- Correction Department office
- Supervisor's office
- Support areas
- Security and CCTV Control Room

Administrative Support

- General Supervisor
- Main Cashier and Supervisor's office
- Support areas

Interstitial Isolation Level – 19,165 SF

Seismic Protection System

- Dedicated seismic isolation level located between the First and Second Floors.
- Provides earthquake protection and operational resilience for the hospital structure.

Second Level – 20,850 SF

Trauma Intensive Care Unit

- 18 private ICU rooms
- 2 Isolation rooms
- Support areas
- Minor Procedure room
- Staff and faculty support areas

Community Support

- 120-seat educational and multipurpose Auditorium

Visitor's Support Areas

- Waiting area
- Exterior Terrace
- Non-denominational Meditation space
- Visitor support services

ASEM Central Services Building Inter-Connection

- Enclosed corridor connector between Trauma Hospital and ASEM Central Services Building

Third Level – 17,650 SF

Visitor's Support Areas

- Waiting area
- Visitor support services

Rehabilitation Department

- Physical Therapy Gym
- Occupational Therapy
- Inpatient rehabilitation services
- Outpatient rehabilitation services
- Electrotherapy
- Support areas

Medical Faculty

- Medical faculty offices

Operational Support Services

- Pre-admissions
- Infection Control
- Institutional Programs
- Medical Record Release
- Support areas
- On-Call Doctor's Area

Patient Wellness

- Private exterior therapeutic patient wellness terrace

Fourth Level – 18,350 SF

Visitor's Support Areas

- Waiting area
- Visitor support services

Trauma Telemetry Nursing Unit

- 18 private patient rooms (Surge Capacity + 18)
- 2 isolation rooms
- Support areas
- Minor Procedure room
- Staff and faculty support areas

Fifth Level – 18,350 SF

Visitor's Support Areas

- Waiting area
- Visitor support services

Trauma Rehabilitation and Intermediate Care Unit

- 18 private patient rooms (Surge Capacity + 18)
- 2 isolation rooms
- Support areas
- Minor Procedure room
- Staff and faculty support areas

Sixth Level – 18,350 SF

Visitor's Support Areas

- Waiting area
- Visitor support services

Trauma Intermediate Care Unit

- 18 private patient rooms (Surge Capacity + 18)
- 2 isolation rooms
- Support areas
- Minor Procedure room
- Staff and faculty support areas

Seventh Level – 18,350 SF

Visitor's Support Areas
- Waiting area
- Visitor support services

Trauma Intermediate Care Unit
- 18 private patient rooms (Surge Capacity + 18)
- 2 isolation rooms
- Support areas
- Minor Procedure room
- Staff and faculty support areas

Eighth Level – 17,650 SF

Visitor's Support Areas
- Waiting area
- Visitor support services

Trauma Hospital Administration
- Trauma Hospital Executive Department
- Trauma Hospital Administrative Department
- Support areas

ASEM Administration
- ASEM Executive Department
- ASEM Administrative Offices
- ASEM Medical Services Offices
- Support areas

Ninth Level – 9,050 SF

Emergency Operations
- Disaster Control Center
- Monitoring Operations Center
- Support areas
- Visitors waiting

Building Infrastructure
- Electro-mechanical Service area
- Storage areas
- Service room

Heliport Support
- Dedicated heliport elevator core
- Access ramp to the service holding terrace and heliport landing pad.

Roof Level – Helipad - 450 SF

Trauma Heliport and Support Areas

- Dedicated heliport elevator core
- Access ramp to Heliport landing pad
- Service patient holding terrace
- Heliport landing pad

5.10.3 Proposed Bed Capacity and Emergency Surge Bed Program Summary

Level / Unit	Standard Patient Rooms / Beds	Isolation Rooms / Beds	Total Proposed Beds	Additional Surge Beds	Total Beds During Surge
First Level – Trauma ICU	10	0	10	0	10
Second Level – Trauma ICU	18	2	20	0	20
Fourth Level – Trauma Telemetry	18	2	20	18	38
Fifth Level – Rehabilitation / Intermediate Care	18	2	20	18	38
Sixth Level – Intermediate Care	18	2	20	18	38
Seventh Level – Intermediate Care	18	2	20	18	38
Total	**100**	**10**	**110**	**72**	**182**

On Levels 4 through 7, the 18 standard patient rooms on each floor shall be planned and constructed by the Design-Build Entity to accommodate one additional bed per room during emergency surge operations, providing an additional 18 surge beds per floor and 72 total additional surge beds, for a double-bed patient room including all required utilities. The Design-Build Entity shall ensure that these rooms are designed and built to support surge capacity and are fully compliant with all applicable codes, standards, regulatory requirements, and the current FGI Guidelines for Design and Construction of Hospitals.

6.0 STRUCTURAL DESIGN NARRATIVE

6.1 INTRODUCTION AND PURPOSE

This Bridging Document establishes the Structural Engineering performance requirements, design criteria, and minimum system standards that the Design-Build (D&B) Contractor must incorporate into the design and construction of the Puerto Rico Trauma Hospital located at Centro Médico, San Juan, Puerto Rico. The structural systems shall be designed to the performance objectives, load criteria, and detailing requirements described herein, consistent with the facility's classification as a Risk Category IV essential facility. The Owner's desired seismic performance for this facility is Maximum Capacity Immediate Occupancy (MC-IO): the building shall retain its full operational capacity, including surge capacity of 182 beds with immediate post-earthquake occupancy following the Maximum Considered Earthquake (MCER) event, without the need for evacuation, significant repair, or de-rated/partial operation. Precisely stated per ASCE 41 terminology, the governing performance objective is Immediate Occupancy Structural Performance Level (S-1, ASCE 41 Section 2.3.1.1) paired with the BSE-2N seismic hazard level, where BSE-2N is equivalent to the Risk-Targeted Maximum Considered Earthquake (MCER) per ASCE 7. This pairing is an Owner-elected performance objective that exceeds the standard codified hospital performance objective, it is not baseline code-minimum practice and shall be clearly identified as such in all design submittals. Where ASCE 7 Chapter 17 code-minimum provisions, ASCE 41 Immediate Occupancy acceptance criteria, and any other applicable standard produce differing demand or acceptance results, the strictest (most restrictive) requirement shall govern. MC-IO shall be verified using the supplemental methodology described in Section 6.3.3.

** REQUIRED: Maximum Capacity Immediate Occupancy (MC-IO) — defined as Immediate Occupancy Structural Performance Level (S-1) at the BSE-2N (MCER) seismic hazard level per ASCE 41 — is the governing performance objective for this facility and applies building-wide — to the seismic isolation system, the substructure and superstructure lateral force-resisting systems, the heliport, and all patient-care and mission-critical spaces identified in Section 6.2.3 — not solely to the isolation system or the Level 9 Disaster Control and Monitoring Operations Center. This objective is confirmed by the Owner to exceed the standard codified hospital performance objective and governs in lieu of it. Wherever ASCE 7 Chapter 17, ASCE 41, or any other applicable standard would otherwise produce a less restrictive result, the strictest applicable performance level and acceptance criteria shall govern. The Design-Build Entity's structural Engineer of Record shall confirm the MC-IO verification methodology and acceptance criteria (Section 6.3.3) with the Owner at Schematic Design phase, subject to independent peer review per Section 6.8.4.*

This document bridges the Owner's programmatic requirements — as established in the Advance Architectural Design Development Document — with the Design-Build Entity's structural design responsibility. The Contractor shall use this document, together with all referenced codes and standards, as the Basis of Design (BOD) for the following structural systems:

- Seismic site hazard characterization, deep excavation, shoring, dewatering, and underpinning/protection of three adjacent occupied hospital buildings, based on and coordinated with the Owner-furnished geotechnical investigation (Section 6.4.1)
- Foundation system
- Seismic isolation system at the isolation plane — isolator units, diaphragms above and below the isolators, perimeter moat/seismic gap, and flexible connections for all rigid elements crossing the isolation interface
- Substructure gravity and lateral force-resisting system (Basement and First/Ground Level, through the isolation plane, fixed-base design)
- Superstructure gravity and lateral force-resisting system (Second Level through Roof/Heliport, isolated design per ASCE 7 Chapter 17)
- Heliport structural support system, including FAA-compliant structural design loads and rooftop
- Structural interface and separation/connection details with the existing ASEM Central Services Building
- Temporary shoring and structural considerations for demolition of the partially constructed Central Plaza portion and the existing ASEM Emergency Department expansion
- Special inspections, structural materials testing, and mandatory independent peer review of the seismic isolation system

The Design-Build Entity shall engage licensed Professional Engineers (PE) for all structural systems. The Engineer of Record responsible for the structural design shall be a Professional Engineer licensed to practice in the Commonwealth of Puerto Rico and an active member in good standing of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR). All design documents and drawings shall be signed and sealed by the Puerto Rico-licensed PE.

** REQUIRED: An independent structural peer review of the seismic isolation system and the superstructure lateral force-resisting system, performed by a qualified peer reviewer with demonstrated seismic isolation experience and retained directly by the Owner, is mandatory per ASCE 7 Section 17.2.6. The Design-Build Entity shall fully cooperate with the peer review process and incorporate all peer reviewer comments.*

6.2 PROJECT OVERVIEW

6.2.1 Facility Description

The Puerto Rico Trauma Hospital is a new 215,880 square foot, ten-story acute care trauma facility to be constructed on the campus of the Puerto Rico Medical Center (Centro Médico) in San Juan, Puerto Rico. The facility will be structurally integrated with the existing ASEM Central Services Building. The building is organized into a fixed-base substructure (Basement and First/Ground Level) and a seismically isolated superstructure (Second Level through the Roof), separated by a seismic isolation plane occupying a discrete structural zone approximately 3'-6" deep between the First and Second Levels.

6.2.2 Critical Areas Driving Structural Design

The Maximum Capacity Immediate Occupancy (MC-IO) performance objective established in Section 1 applies to all patient-care and mission-critical spaces identified below, in addition to the seismic isolation system, the lateral force-resisting systems (Section 6.8), and the heliport (Section 6.10). Structural design and MC-IO verification for these spaces shall specifically address continued post-MCER functionality at full surge capacity, not solely code-minimum life-safety performance.

- 5 Trauma Operating Rooms (Ground Level) — elevated floor dead load from lead-lined shielding partitions, heavy ceiling-mounted surgical booms and equipment, and stringent floor vibration criteria
- Imaging Department — CT Scanner and X-Ray (Ground Level) — thickened slabs and reinforced walls to support radiation shielding (poured lead or lead-lined gypsum), plus low-vibration floor framing
- Trauma ICU wings (multiple levels) — long-span, column-free bays required for flexible bed layout and future reconfiguration
- 120-seat educational and multipurpose auditorium (Level 2) — long-span roof/floor framing and assembly occupancy live loads
- Exterior roof terrace and garden (Level 2) — planter/soil dead load, waterproofing substrate slope, and guardrail anchorage loads
- Heliport (Roof Level) — FAA-compliant structural design loads, crash/emergency landing load provisions, and a dedicated structural core independent of typical floor framing
- Seismic Isolation Plane (between First and Second Levels) — a discrete ≈3'-6" deep structural zone housing the isolator bearings and an added layer of transfer girders; requires a continuous rigid diaphragm above
- Disaster Control and Monitoring Operations Center (Level 9) — enhanced anchorage requirements for critical non-structural components and equipment consistent with Risk Category IV post-event functionality; the required post-event performance level for this space and its critical systems is Maximum Capacity Immediate Occupancy (MC-IO), per the building-wide objective stated in Section 6.1 and Section 6.7.1

** REQUIRED: The Disaster Control and Monitoring Operations Center (Level 9) and its critical non-structural components, equipment, and anchorage shall be designed for Maximum Capacity Immediate Occupancy (MC-IO) performance following the Maximum Considered Earthquake (MCER) event, per Section 6.1. The Design-Build Entity's structural Engineer of Record shall determine component seismic design forces per ASCE 7 Chapter 13 using a component importance factor Ip = 1.5, coordinated with the reduced floor accelerations applicable to the isolated superstructure (Section 6.8.2), and shall identify the specific critical systems (power, communications, monitoring/control equipment) covered by this requirement in coordination with the Owner and the companion Electrical Bridging Document.*

- Emergency Generator Plant and diesel storage (Basement) — heavy equipment foundations, and structural separation/fire-rated construction coordination with the generator and paralleling switchgear rooms
- Deep basement excavation (~30 feet) directly adjacent to three continuously operating hospital buildings — the ASEM Central Services Building, the Oncological Hospital, and the San Juan Municipal Hospital

6.3 APPLICABLE CODES AND STANDARDS

The Design-Build Entity's design shall comply as a minimum with the following codes, standards, and guidelines. Where conflicts exist, the most stringent requirement shall govern. The Contractor is responsible for determining any additional codes adopted locally in Puerto Rico at the time of permit application.

6.3.1 Federal and Local Codes

- Puerto Rico Building Code (PRBC) — incorporates by reference the 2018 International Building Code (IBC) with corresponding Puerto Rico amendments, and the 2018 International Existing Building Code (IEBC) where applicable to the ASEM Central Services Building interface, latest editions adopted in Puerto Rico
- Americans with Disabilities Act (ADA) — 2010 ADA Standards for Accessible Design (structural coordination for ramps, platform lifts, and accessible route framing)
- FAA Advisory Circular AC 150/5390-2D — Heliport Design (or latest FAA-adopted edition at time of permit; structural loading and clearance requirements for the rooftop heliport)

6.3.2 ACI / AISC / Concrete and Steel Standards

- ASCE 7 — Minimum Design Loads and Associated Criteria for Buildings and Other Structures (latest edition adopted in Puerto Rico), including Chapter 17 (Seismic Design Requirements for Seismically Isolated Structures) and Chapters 26–31 (Wind Loads)
- ACI 318 — Building Code Requirements for Structural Concrete, including Chapter 18 (Earthquake-Resistant Structures)

- ACI 350 / ACI 372 — as applicable to below-grade water-retaining or containment structures (fuel spill containment basins, cisterns)
- AISC 341 — Seismic Provisions for Structural Steel Buildings, retained for reference only in the event any minor, non-primary steel element requires seismic force-resisting detailing (Section 6.11.2)
- AISC 358 — Prequalified Connections for Special and Intermediate Steel Moment Frames
- ACI 355.2 / ACI 355.4 — Qualification of post-installed and cast-in anchors for isolator-to-concrete connections
- ASCE 41 — Seismic Evaluation and Retrofit of Existing Buildings, referenced for interface analysis with the existing ASEM Central Services Building

6.3.3 Seismic Isolation Standards

- ASCE 7 Chapter 17 — Seismic Design Requirements for Seismically Isolated Structures — governs isolation system design, minimum lateral displacements, and superstructure/substructure force reduction factors
- ASCE 7 Section 17.8 — Design, Manufacturing, and Testing Requirements for isolator prototype and production testing
- ASCE 7 Section 11.4.8 / 17.3 — Site-Specific Ground Motion Procedures, mandatory for Risk Category IV isolated structures on this site
- ASCE 41 — Seismic Evaluation and Retrofit of Existing Buildings, referenced here for its structural performance level definitions and associated deformation- and force-based acceptance criteria; the governing performance objective for this project is Immediate Occupancy Structural Performance Level (S-1, ASCE 41 Section 2.3.1.1) paired with the BSE-2N seismic hazard level (equivalent to MCER per ASCE 7), used as the supplemental verification basis for the Maximum Capacity Immediate Occupancy (MC-IO) performance objective established in Section 6.1, since compliance with ASCE 7 Chapter 17 force-based provisions alone does not constitute demonstrated MC-IO performance. Note that ASCE 41's BSE-1N hazard level (two-thirds of BSE-2N) is numerically analogous to, but not the same defined term as, the ASCE 7 Chapter 17 Design Basis Earthquake (DBE) used elsewhere in this document (Section 6.7.1); where a distinction matters, the BSE-2N (MCER)-paired Immediate Occupancy criteria of this Section govern per the strictest-governs principle of Section 6.1

** REQUIRED: The Design-Build Entity's Structural Engineer of Record shall perform nonlinear response history analysis (NLRHA) of the isolated structure per ASCE 7 Chapter 16/17 procedures and evaluate the results against ASCE 41 Immediate Occupancy structural performance acceptance criteria, covering drift, isolator displacement, component deformation, and floor acceleration demands, to demonstrate the Maximum Capacity Immediate Occupancy objective of Section 6.1 at MCER. Results shall be submitted to the Owner and the independent peer reviewer for acceptance prior to Design Development completion.*

6.3.4 Healthcare Facility Guidelines

- Facility Guidelines Institute (FGI) Guidelines for Design and Construction of Hospitals
- Joint Commission Environment of Care standards
- FAA Advisory Circular AC 150/5390-2

6.4 GEOTECHNICAL INVESTIGATION AND SITE CONDITIONS

6.4.1 Subsurface Conditions

The project site is located within the Centro Médico campus in San Juan, given the approximately 30-foot basement excavation required across the majority of the building footprint, the Owner will provide comprehensive geotechnical investigation, including a sufficient number of borings distributed across the site (and extended below the anticipated foundation bearing elevation), in-situ testing, laboratory testing, and groundwater monitoring wells, to characterize the following at a minimum:

- Soil stratigraphy, strength, and compressibility parameters for foundation design
- Groundwater elevation and seasonal fluctuation, for dewatering and buoyancy/uplift design
- Liquefaction potential of saturated cohesionless strata under design seismic loading
- Soil and groundwater corrosivity/aggressivity, for concrete mix design and reinforcement protection
- Lateral earth pressure parameters (at-rest, active, passive) for basement wall and shoring design, including surcharge effects from adjacent structures and construction equipment

** PROVIDED: A site-specific geotechnical investigation and report, addressing liquefaction potential, bearing capacity, groundwater control recommendations, and foundation recommendations for the Advance Design Concept provided in this Document.*

6.4.2 Seismic Site Hazard

Given the combination of Risk Category IV occupancy, a seismically isolated structural system, and a site class anticipated to be Site Class D or softer pending geotechnical confirmation, a site-specific Maximum Considered Earthquake (MCER) ground motion hazard analysis is required per ASCE 7 Sections 11.4.8 and 17.3, rather than reliance on the general code response spectrum alone.

- Site Class: to be confirmed by the geotechnical investigation; preliminarily assumed as Site Class D for planning purposes
- Seismic Design Category: anticipated to be Category D or higher; to be confirmed following the site-specific hazard analysis

- Site-specific response spectra (MCER and design-level/DBE) shall be developed for both the isolation system design (Chapter 17 procedures) and, if triggered by site class, the general structural design; preliminary site-specific spectral parameters developed for the isolation system concept design (Section 6.7.1) indicate a short-period spectral plateau
- Ground motion time histories shall be developed and scaled per ASCE 7 Chapter 16/17 procedures if response-history analysis is used for the isolated structure, which is expected given the Risk Category IV classification and the isolation system

** REQUIRED: The Design-Build Entity's structural Engineer of Record shall confirm, and if necessary refine, the preliminary site-specific seismic hazard parameters referenced above through an independent site-specific study at Schematic Design phase.*

6.5 EXCAVATION, SHORING, AND ADJACENT STRUCTURES

6.5.1 Excavation

The project will require an approximately 30-foot deep excavation across the entirety of the approximately 40,000 square foot proposed building footprint to accommodate the Basement Level and the structural foundation system. The excavation depth and site constraints — bounded by the ASEM Central Services Building to the north, the Pedro Arzuaga Beraza Plaza to the south, the Oncological Hospital to the east, and the San Juan Municipal Hospital to the west — require a fully shored excavation with no sloped/open-cut perimeter.

6.5.2 Shoring and Dewatering

- Shoring System: a continuous perimeter shoring wall — secant pile wall, soldier pile and lagging, or diaphragm (slurry) wall as selected by the Design-Build Entity — designed for the full excavation depth, adjacent structure surcharge, hydrostatic pressure, and construction live loads
- Lateral Support: tieback anchors (where permitted by adjacent property/easement constraints) or internal cross-lot bracing/rakers, designed to limit wall deflection to values compatible with the settlement tolerance of adjacent occupied hospital structures
- Dewatering: given the anticipated shallow groundwater table in the coastal alluvial soils, a dewatering system (wellpoints or deep wells with sump collection) shall be designed to lower the water table below excavation subgrade during construction, with discharge permitting per local environmental agencies; dewatering-induced settlement of adjacent structures shall be evaluated and mitigated
- Permanent Waterproofing: the below-grade basement structure shall be provided with a continuous waterproofing membrane system and detailed for hydrostatic pressure and buoyancy resistance at the design groundwater elevation

6.5.3 Adjacent Structures Protection and Monitoring

The ASEM Central Services Building, the Oncological Hospital, and the San Juan Municipal Hospital are occupied, operating hospital facilities that must remain in continuous service throughout construction. The Design-Build Entity shall implement a comprehensive instrumentation and monitoring program prior to, during, and after excavation and foundation construction.

** REQUIRED: A structural engineer licensed in Puerto Rico shall certify the adequacy of the shoring and monitoring program, and the monitoring program shall be reviewed and accepted by the Owner prior to the start of excavation.*

6.6 FOUNDATION SYSTEM

6.6.1 Foundation Type and Design Basis

The foundation system shall be designed by the Design-Build Entity based on the Owner-furnished, site-specific geotechnical investigation for this Advance Design Concept of the Proposed Trauma Hospital (Section 6.4.1) and shall accommodate both the substructure gravity/lateral loads and the concentrated column reactions delivered by the seismic isolators at the isolation plane, which are typically higher and more concentrated than conventional column loads due to the isolator bearing arrangement. The Design-Build Entity may rely on the Owner-furnished geotechnical report for foundation design purposes; the Design-Build Entity's Structural Engineer of Record shall review the report for adequacy and, where foundation-critical parameters (bearing capacity, liquefaction potential, or differential settlement tolerance at isolator support locations) warrant additional confirmation, may recommend supplemental exploration to the Owner. Any subsurface conditions encountered during construction that materially differ from those indicated in the Owner-furnished report shall be promptly reported to the Owner.

6.6.2 Basement Walls and Waterproofing

- Basement perimeter walls: reinforced cast-in-place concrete, shall be designed for at-rest or active lateral earth pressure (as applicable to the permanent condition), hydrostatic pressure, and surcharge loads from the adjacent structures, roadways, and construction equipment
- Basement walls also act as below-grade shear walls contributing to the substructure lateral force-resisting system described in Section 6.8.1
- Waterproofing: continuous membrane waterproofing system on the exterior face of all below-grade walls and beneath the mat foundation, with detailing at all construction joints, penetrations, and the shoring wall interface (where the shoring wall is incorporated as permanent construction)
- Spill Containment Coordination: the Basement Generator Room diesel day tanks and the bulk diesel storage tank require dedicated spill containment basins per NFPA 30/37/110;

the structural slab and containment curbs at these areas shall be designed liquid-tight and coordinated with the mechanical/electrical scope

6.7 SEISMIC ISOLATION SYSTEM

A seismic isolation plane is provided between the First (Ground) Level and the Second Level of the building. This isolation plane occupies a structural zone approximately 3'-6" (42 inches) deep, accommodating the isolator units and an added layer of transfer beams. This isolation plane serves as the facility's primary earthquake protection system, designed to reduce seismic damage and provide continued post-earthquake functionality for this Risk Category IV Trauma Facility.

6.7.1 Isolation System Basis of Design

- The building is divided into a fixed-base substructure and a seismically isolated superstructure, separated by the isolation interface
- Design basis per ASCE 7 Chapter 17: the isolation system and structural elements below the isolation interface shall be designed for MCER-level forces, while the isolated superstructure above is designed for substantially reduced forces reflecting the added period shift and damping provided by the isolators
- Performance Objective: Maximum Capacity Immediate Occupancy (MC-IO) — Immediate Occupancy Structural Performance Level (S-1) at the BSE-2N (MCER) seismic hazard level per ASCE 41 Section 2.3.1.1, per Section 6.1 — the isolation system and the isolated superstructure it supports shall enable the facility to retain full operational capacity, including surge capacity (182 beds), with immediate post-earthquake occupancy, consistent with the facility's function as a post-disaster trauma treatment and Disaster Control and Monitoring Operations Center; verification methodology per Section 6.3.3
- Site-Specific Ground Motion: a site-specific MCER/DBE spectral analysis shall be developed for this project's isolation system design
- Isolator Layout: isolator units are located atop selected column and wall lines, not necessarily every column, as determined by the gravity and lateral load distribution; a continuous rigid floor diaphragm at the top of the isolation zone unifies all wings and blocks of the hospital's articulated floor plan into a single, continuous seismically isolated superstructure

** REQUIRED: The Design-Build Entity's Structural Engineer of Record shall confirm and finalize the site-specific MCER/DBE ground motion hazard analysis (or perform an independent site-specific analysis per ASCE 7 Sections 11.4.8 and 17.3) at Schematic Design phase.*

6.7.2 Isolator Units — Minimum Performance Criteria

The isolation system shall be specified on a performance basis, so that isolator units from any qualified manufacturer meeting the minimum criteria below may be proposed, subject to the acceptance of the structural Engineer of Record and the independent peer reviewer.

- Design Displacements: each isolator shall be sized for the Design Displacement (DD) and Maximum Displacement (DM) per ASCE 7 Section 17.5, including additional torsional displacement demand due to any eccentricity between the center of mass and center of rigidity of the isolation system
- Prototype Testing: per ASCE 7 Section 17.8, a minimum of two full-scale prototype units of each isolator type and size shall be tested for compliance, including cyclic testing at MCER displacement; the effects of aging, wear, temperature, and scragging shall be incorporated into the isolator property modification factors used in design
- Production Quality Control Testing: 100% of production isolator units shall undergo quality control testing at a minimum vertical test load consistent with the average seismic weight per isolator with a minimum of three full displacement cycles per unit, confirming that friction/stiffness and damping properties fall within the upper-bound and lower-bound property envelope established by prototype testing
- A perimeter seismic movement gap shall be provided around the entire isolated superstructure at all levels above the isolation plane, consistent with the project's design-basis maximum displacement demand plus the code-required clearance margin per ASCE 7 Section 17.5.3.7
- Seismic joint covers (floor, wall, and ceiling) capable of accommodating the full design displacement in all horizontal directions shall be provided , stair and elevator penetrations of the isolation plane, and the corridor connector to the existing ASEM Central Services Building
- Corridor Connector Interface: since the existing ASEM Central Services Building is not seismically isolated, the Level 2 corridor connector between the isolated Trauma Hospital superstructure and the fixed ASEM building shall incorporate a sliding/flexible structural connection (seismic separation joint) sized for the full isolator displacement demand, so that no rigid connection exists across the isolation boundary

** REQUIRED: Final seismic gap dimensions at all locations shall be confirmed by the Design-Build Entity's Structural Engineer of Record based on the final site-specific maximum displacement calculation.*

- All rigid structural, architectural, and MEP elements crossing the isolation interface — stairs, elevator shafts, mechanical/electrical/plumbing risers, and any structural bracing — shall include flexible connections, sliding joints, or sufficient slack/loop capacity to accommodate the full design displacement demand in all horizontal directions without damage

- Elevator shafts penetrating the isolation plane shall include a structural sliding seismic joint at the shaft walls within the isolation zone, coordinated with the elevator manufacturer's rail and guide clearances
- Coordination with MEP disciplines is required for conduit, cable tray, piping, and duct loop/flexible connection details within the isolation zone; this coordination corresponds to the flexible connection requirements

6.8 LATERAL FORCE-RESISTING SYSTEM

6.8.1 Below Isolation Plane

- The Basement and Ground (First) Level, through the base of the isolation plane, form an essentially rigid, fixed-base substructure supporting the isolation system
- Lateral System: reinforced concrete special moment frames and reinforced concrete special shear walls, acting together as a dual system, sized for minimal drift, designed for MCER-level (essentially elastic) forces per ASCE 7 Chapter 17 requirements — the substructure is not permitted to rely on the isolation system's period shift or damping benefit; essentially elastic substructure response is a necessary but not sufficient condition for the Maximum Capacity Immediate Occupancy (MC-IO) objective of Section 1, which shall be confirmed.
- Below-grade basement walls act as additional shear walls, engaging passive soil resistance where applicable

6.8.2 Above Isolation Plane

- Levels 2 through 9 and the Roof/Heliport form the seismically isolated superstructure, designed for the reduced force levels permitted by ASCE 7 Chapter 17 for isolated structures
- Lateral System: reinforced concrete special moment frames and reinforced concrete special shear walls, acting together as a dual system per ACI 318 Chapter 18 and ASCE 7 Table 12.2-1, consistent with the proposed structural system — the superstructure shall be concrete throughout, matching the substructure system of Section 6.8.1; the selected configuration and layout of moment frame bays and shear wall lines is subject to peer review acceptance; the selected system's drift and component demands shall be evaluated against ASCE 41 Immediate Occupancy acceptance criteria per Section 6.3.3 in support of the Maximum Capacity Immediate Occupancy (MC-IO) objective of Section 6.1, which may govern over the Chapter 17 code-minimum drift limits noted below
- Drift Limits: superstructure story drift shall be limited per ASCE 7 Chapter 17 provisions for isolated structures, which are generally more permissive than fixed-base equivalents due to the reduced superstructure demand, but shall still be checked against isolator displacement compatibility and moat clearance at every level; where the Chapter 17 drift limit is less restrictive than the ASCE 41 Immediate Occupancy drift limit applicable under the Maximum Capacity Immediate Occupancy (MC-IO) objective of Section 6.1, the more restrictive limit shall govern

- Redundancy: the superstructure lateral system shall meet the redundancy factor and height limitations applicable to isolated structures per ASCE 7 Chapter 17 and the Seismic Design Category determined in Section 6.4.2

6.8.3 Wind Design Criteria

- Basic Wind Speed: 180 mph, 3-second gust, Risk Category IV, per ASCE 7 Chapters 26–30 and the Puerto Rico Building Code; Exposure Category to be confirmed by site-specific terrain survey
- Components and Cladding: wind pressures for exterior wall systems, parapets, rooftop equipment screens, and the heliport structure shall be determined per ASCE 7 Chapter 30
- Occupant Comfort: given the 10-story height and the dynamic characteristics of the isolated superstructure, wind-induced building acceleration at upper occupied floors shall be evaluated against recognized occupant comfort criteria
- Isolator Behavior Under Wind: the isolation system shall provide sufficient initial stiffness such that the superstructure does not displace under service-level wind loads, per ASCE 7 Section 17.2.4.4; the Design-Build Entity shall confirm wind-restraint adequacy of the selected isolator type or provide a supplemental wind-restraint mechanism as needed

Wind Parameter	Value / Basis
Basic Wind Speed, V	180 mph, 3-second gust (Category 5 hurricane region)
Risk Category	IV
Exposure Category	C (to be confirmed by site-specific terrain survey; D if governed by proximity to open coastal exposure)
Directionality Factor, Kd	0.85, typical for buildings and other structures per ASCE 7
Topographic Factor, Kzt	1.0 assumed; to be confirmed no topographic speed-up condition applies per ASCE 7 Section 26.8
Ground Elevation Factor, Ke	1.0, typical at project elevation
Enclosure Classification	Enclosed, except where specific openings (e.g., mechanical louvers) require partially enclosed classification per ASCE 7 Section 26.2

6.8.4 Seismic Design Criteria

- Risk Category IV, with the corresponding Importance Factor applied to the substructure design per ASCE 7 Chapter 11

- Site Class and Seismic Design Category per the site-specific investigation described in Section 6.4.2; anticipated Site Class D and Seismic Design Category D or higher, to be confirmed
- Site-specific MCER ground motion procedures required per ASCE 7 Sections 11.4.8 and 17.3 for both the isolation system design and the substructure/superstructure structural design

Seismic Parameter	Value / Basis
Risk Category	IV
Seismic Importance Factor, Ie	1.5, per ASCE 7 Table 1.5-2 for Risk Category IV
Mapped Spectral Accelerations, Ss / S1	To be obtained from the ASCE 7 / Puerto Rico Building Code seismic hazard maps for the project site (Centro Médico, San Juan) by the Design-Build Entity's Structural Engineer of Record
Site Class	D, anticipated; to be confirmed by the geotechnical investigation (Section 4.1)
Design Spectral Parameters, SDS / SD1	To be calculated once Ss, S1, and Site Class are confirmed; superseded for isolation system design by the site-specific MCER/DBE analysis of Section 7.1
Seismic Design Category	D or higher, anticipated; to be confirmed following the site-specific hazard analysis
Substructure Seismic Force-Resisting System (fixed-base, Section 8.1)	Special Reinforced Concrete Moment Frame and Special Reinforced Concrete Shear Wall Dual System; the moment frames shall be proportioned per ASCE 7 Section 12.2.5.1
Superstructure (Isolated) Design Basis (Section 8.2)	Per ASCE 7 Chapter 17 isolated-structure force reduction provisions, not the conventional R-factor approach used for the substructure; RI is derived from the same concrete special moment frame/special shear wall dual system base R value used for the substructure (Section 8.4), per ASCE 7 Section 17.5.4.2, and shall be confirmed by the Engineer of Record once the substructure R value is finalized
Analysis Procedure	Equivalent Lateral Force procedure permitted for the substructure where applicable per ASCE 7 Chapter 12; dynamic (response-spectrum or response-history) analysis required for the isolated superstructure per ASCE 7 Chapter 17

Table 1 below summarizes the principal structural design criteria referenced throughout this document.

Design Parameter	Criteria	Notes
Risk Category	IV	Essential facility — trauma hospital with post-disaster function
Basic Wind Speed	180 mph (3-second gust)	Category 5 hurricane region; Exposure Category C (confirm with site survey)
Seismic Design Category	D (anticipated)	To be confirmed by site-specific hazard analysis
Site Class	D (anticipated)	To be confirmed by geotechnical investigation
Live Load — Patient Rooms	40 psf	Per IBC Table 1607.1
Live Load — Operating Rooms	60 psf	Plus superimposed equipment loads per manufacturer data
Live Load — Corridors above 1st Floor	80 psf	Per IBC Table 1607.1
Live Load — Assembly / Auditorium	100 psf	Level 2, 120-seat auditorium
Live Load — Mechanical / Electrical Rooms	150 psf minimum	Confirm against actual equipment weights
Live Load — Roof (general)	20 psf minimum	Plus heliport design loads per FAA AC 150/5390-2D (or latest FAA-adopted edition at time of permit)
Basement Excavation Depth	≈30 feet	Full building footprint, ≈40,000 SF
Groundwater Control	Dewatering + permanent waterproofing	Shallow water table expected

6.9 GRAVITY FRAMING SYSTEM

6.9.1 Floor Framing by Level

- Substructure (Basement and Ground Level, plus the isolation plane transfer girders): conventional reinforced concrete flat slab, or beam-and-slab framing, on concrete columns and shear walls, sized to collect and transfer isolator reaction loads down to the foundation
- Second Level Diaphragm (base of isolated superstructure): the Second Level floor framing directly above the isolation plane shall be designed as a continuous rigid diaphragm unifying all wings of the hospital's articulated plan (ICU wing, auditorium block, and ASEM corridor connector approach) into a single isolated structural unit, notwithstanding the building's non-rectangular footprint
- Superstructure (Levels 2 through 9): reinforced concrete flat plate or reinforced concrete beam-and-slab framing, consistent with the concrete moment frame/shear wall dual lateral system of Section 6.8.2; the Design-Build Entity's Structural Engineer of Record shall select the specific concrete floor system, coordinated with floor-to-floor height constraints and isolator vertical load efficiency
- Roof: reinforced concrete roof slab, consistent with the concrete superstructure of Section 6.9.1, equipment curbs and support framing shall be designed for equipment operating weight, seismic anchorage forces, and 180 mph design wind uplift. The heliport structure (Section 6.10) is reinforced concrete, consistent with the all-concrete primary structural system; minor, non-primary structural steel (equipment support racks, screen wall framing, ladders, and similar discrete rooftop platforms) is permitted, such elements are not part of the building's primary gravity or lateral force-resisting system
- Roof Terrace, Level 2: structural slab designed for planter/soil dead load, waterproofing system substrate, drainage slope, and guardrail/parapet anchorage loads in addition to standard roof live load

6.9.2 Vibration Criteria for Sensitive Equipment

- Imaging Suite (CT / X-Ray): floor vibration shall be limited to Vibration Criterion VC-C, or the specific imaging equipment manufacturer's requirement, whichever is more stringent
- Trauma Operating Rooms: floor stiffness shall be evaluated to limit vibration and deflection under surgical boom loads, equipment carts, and foot traffic, consistent with FGI Guidelines for surgical suites
- General Patient Care Floors: standard live load deflection limits (L/360) per IBC apply, with additional stiffness review at long-span bays

6.10 HELIPORT STRUCTURE

The Roof Level heliport shall be supported on a dedicated structural core independent of the typical roof framing, designed to accommodate FAA-compliant structural loading in addition to the seismic isolation, wind, and gravity criteria applicable to the remainder of the isolated

superstructure. Given the heliport's role in post-disaster patient transport and evacuation at full surge capacity, the heliport structure is included within the Maximum Capacity Immediate Occupancy (MC-IO) performance objective of Section 6.1 and shall remain operational immediately following the MCER event.

- Structural System: dedicated reinforced concrete elevated landing pad structure, consistent with the all-concrete primary structural system of Section 6.8; supported by the Level 9 heliport elevator core and access ramp framing described in the Advanced Design Documents.
- Design Loads: helicopter design loads (static and dynamic wheel/skid loads) per the applicable FAA Helicopter Design Group, superimposed live load, and emergency/crash landing load provisions per FAA Advisory Circular AC 150/5390-2D and IBC Section 1607.11, heliport structural design loads.
- Obstruction and Approach Surfaces: the structural design of the heliport core, elevator overrun, and any adjacent rooftop equipment shall respect the FAA-defined obstacle clearance surfaces per AC 150/5390-2D (or latest FAA-adopted edition at time of permit), coordinated with the electrical scope's obstruction lighting requirements
- Service Holding Terrace: structural slab and guardrail anchorage for the service holding terrace adjacent to the heliport landing pad, designed for pedestrian and light equipment live loads plus wind uplift

6.11 STRUCTURAL MATERIALS

6.11.1 Cast-in-Place Concrete

- Foundation system and below-grade walls: minimum f'c = 5,000 psi, normal weight concrete, low-permeability mix design for corrosion resistance and waterproofing compatibility
- Isolation Level structure (isolator pedestals and diaphragms): minimum f'c = 5,000 psi, detailed for the concentrated isolator bearing loads and anchorage per ACI 355.2/355.4
- Superstructure concrete elements (special moment frames and special shear walls, Section 6.8.2): minimum f'c = 4,000 psi as required by special shear wall/moment frame detailing per ACI 318 Chapter 18

6.11.2 Structural Steel

- Wide-flange shapes: ASTM A992, Fy = 50 ksi
- HSS bracing members: ASTM A500 Grade C, or ASTM A1085 where enhanced seismic ductility is required
- Seismic detailing per AISC 341 and prequalified connections per AISC 358 apply only in the event any minor, non-primary steel element (rooftop equipment platforms, screen wall framing, or similar) is designated as seismic-force-resisting; no structural steel is proposed for the primary structural system of this facility, including the heliport (Section 6.10), which is reinforced concrete throughout per Section 6.8

6.11.3 Reinforcing Steel

- Special seismic force-resisting elements (shear walls, moment frame regions, isolation level diaphragms): ASTM A706 Grade 60 weldable reinforcing steel for ductile detailing per ACI 318 Chapter 18
- General reinforcement (gravity-only elements): ASTM A615 Grade 60

6.11.4 Miscellaneous Steel Products and Masonry

In addition to the primary wide-flange and HSS members of Section 6.11.2, the following material specifications apply to miscellaneous steel products and, where used for infill or partition construction, masonry:

Product	Specification
Angles, Channels, Plates	ASTM A36
HSS — Rectangular	ASTM A500, Grade B (or Grade C where enhanced seismic ductility is required, per Section 11.2)
HSS — Round	ASTM A500, Grade B (Fy = 42 ksi)
Pipe	ASTM A53, Grade B
Threaded Rod	ASTM A36
Anchor Rods	ASTM F1554, Grade 36
High-Strength Bolts	ASTM A325 / F3125 Grade A325 (or A490 / F3125 Grade A490 where required by connection design)
Welding Electrodes	70 ksi minimum tensile strength (E70XX series), matching AWS D1.1/D1.8 seismic requirements for demand-critical welds
Masonry (infill / partition walls, where used)	f'm = 2,000 psi, normal weight concrete masonry units, reinforced per TMS 402/602 and the Puerto Rico Building Code

6.11.5 Corrosion Protection

- Below-grade reinforced concrete elements: epoxy-coated reinforcement or corrosion-inhibiting admixtures, combined with low-permeability mix design
- Exposed structural steel, rooftop equipment supports, exterior canopies, and others, hot-dip galvanized or high-performance coating system rated for a coastal/tropical exposure, consistent with the corrosion-resistance requirements noted for exterior electrical and mechanical equipment enclosures

6.12 DESIGN-BUILD ENTITY SCOPE AND KEY DESIGN CONSTRAINS

6.12.1 Items Fully in Design-Build Entity Scope

- Structural design by a Professional Engineer (PE) licensed in Puerto Rico and an active member of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR); all drawings and design documents signed and sealed by the Puerto Rico-licensed PE
- Site-specific seismic hazard analysis (ground motion procedures per ASCE 7 Sections 11.4.8 and 17.3), excavation, shoring, dewatering, and adjacent structures monitoring program described in Sections 6.4 and 6.5, based on and coordinated with the Owner-furnished geotechnical investigation described in Section 6.4.1
- Review, reliance upon, and structural incorporation of the Owner-furnished geotechnical investigation and report (Section 6.4.1); the Design-Build Entity's structural Engineer of Record shall review the Owner-furnished report for adequacy and applicability to the final foundation and shoring design, and shall promptly notify the Owner in writing of any observed or actual subsurface conditions materially differing from those indicated in the Owner-furnished report
- Complete foundation system and basement walls/waterproofing described in Section 6
- Complete seismic isolation system, including isolator units, prototype/production testing, isolation plane diaphragms, seismic gap, and all flexible connections for elements crossing the isolation interface described in Section 6.7
- Complete substructure and superstructure lateral and gravity framing systems described in Sections 8 and 9
- Heliport structural support system described in Section 6.10
- All permits, inspections, and regulatory approvals for structural systems (PRBC, PRDOH, FAA heliport review)
- Coordination and cooperation with the independent seismic isolation peer review process described in Section 6.1 and Section 6.8.4
- 6.12.2 Key Design Constraints
- Mandatory Maximum Capacity Immediate Occupancy (MC-IO) performance objective (Section 6.1) applying building-wide to the isolation system, substructure and superstructure lateral systems, heliport, and all patientcare and mission-critical spaces (Section 6.2.3) — verified via ASCE 41 acceptance criteria in addition to ASCE 7 Chapter 17 code-minimum compliance
- Mandatory site-specific MCER ground motion hazard analysis given the combination of Risk Category IV occupancy, seismic isolation, and anticipated Site Class D or softer conditions
- Mandatory independent structural peer review of the isolation system and superstructure lateral system per ASCE 7 Section 17.2.6 — Design-Build Entity shall not proceed to permit submission without incorporating peer review comments
- No rigid structural connection permitted across the isolation plane or between the isolated superstructure and the existing (non-isolated) ASEM Central Services Building — all such interfaces require flexible/sliding seismic joints sized for full MCER displacement

- The seismic isolation plane occupies approximately ≈3'-6" deep structural zone between the First and Second Levels;
- 30-foot deep excavation directly adjacent to three continuously operating hospital facilities requires a fully engineered shoring, dewatering, and monitoring program with documented threshold/action levels, established and accepted before excavation begins
- Hurricane/tropical environment: all exposed structural steel and exterior connections shall be designed for 180 mph wind speed per ASCE 7/PRBC and detailed with corrosion protection appropriate for Puerto Rico's climate; the reinforced concrete heliport structure (Section 6.10) shall likewise be designed for 180 mph wind speed and detailed with the corrosion-resistant concrete mix design and reinforcement protection
- Hazardous materials abatement (asbestos/lead) in the Central Plaza and ASEM Emergency Department expansion demolition areas must be completed and cleared prior to the start of structural demolition and new foundation work

6.13 STRUCTURAL DESIGN NARRATIVE ANNEXES

The following annex drawings are included for reference, illustrating the structural configuration of key systems described in this Bridging Document:

ELECTRICAL SYSTEMS

Power Distribution • Lighting • Communications • Fire Alarm • Special Systems

7.1 INTRODUCTION AND PURPOSE

This Bridging Document establishes the Electrical Engineering performance requirements, design criteria, and minimum system standards that the Design-Build (D&B) Contractor must incorporate into the design and construction of the Puerto Rico Trauma Hospital located at Centro Médico, San Juan, Puerto Rico. All electrical distribution equipment serving both essential (Life Safety, Critical, and Equipment System branches) and non-essential (Optional Standby) building loads shall be designed with a minimum 10% spare capacity for future load growth.

This document bridges the Owner's programmatic requirements — as established in Advance Architectural Design Development Document — with the Design-Build Entity's design responsibility. The Contractor shall use this document, together with all referenced codes and standards, as the Basis of Design (BOD) for the following electrical systems:

- Utility service at 38 kV and outdoor yard-type substation with step-down to 13.2 kV medium-voltage distribution
- Normal power distribution — double-ended 13.2 kV to 480 V substation, including its secondary switchgear sections with two electrically-operated main breakers, four distribution breaker sections, and one electrically-operated tie breaker
- Emergency and standby power — diesel generators, automatic transfer switches, NFPA 99 Essential Electrical System, and Optional Standby System
- Uninterruptible power supply (UPS) for critical clinical and IT loads
- Grounding and bonding
- Interior, emergency, exterior, and heliport lighting systems
- Telecommunications — rough-in (pathways, conduit, cable tray, and room provisioning) only for structured cabling, which is not in the Design-Build Entity's contract scope; nurse call — complete system, including wiring and equipment; public address, CCTV, and access control — rough-in only (conduit, backboxes, and cable pathways), with devices and equipment furnished and installed by others
- Fire alarm system
- Lightning protection system

The Design-Build Entity shall engage licensed Professional Engineers (PE) for all electrical systems. The Engineer of Record responsible for the electrical design shall be a Professional Engineer licensed to practice in the Commonwealth of Puerto Rico and an active member in good standing of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR). All design documents and drawings shall be signed and sealed by the Puerto Rico-licensed PE. The Design-Build Entity shall submit design documents for Owner review at Schematic Design (SD), Design Development (DD), and Construction Documents (CD) phases.

7.2 PROJECT OVERVIEW

7.2.1 Facility Description

The Puerto Rico Trauma Hospital is a new 215,880 square foot, ten-story acute care trauma facility to be constructed on the campus of the Puerto Rico Medical Center (Centro Médico) in San Juan, Puerto Rico. The facility will be structurally integrated with the existing ASEM Central Services Building at three levels.

7.2.2 Critical Areas Driving Electrical Design

- 5 Trauma Operating Rooms (Ground Level) — highest electrical load density; essential power, isolated power panels (IPPs), and IT equipment per NFPA 99
- Trauma Stabilization — 16 treatment cubicles + 1 airborne infection isolation (AII) room; essential power required at all stations
- Trauma ICU — 28 private rooms + 4 isolation rooms (Levels 1 & 2); bedhead units with essential branch power, data, and nurse call
- Imaging Department — CT Scanner and X-Ray (Ground Level); dedicated power feeders and shielding coordination
- Heliport (Roof Level) — FAA-compliant obstruction and approach lighting; essential power
- Disaster Control and Monitoring Operations Center (Level 9) — independent essential and UPS power; redundant communications infrastructure
- Cafeteria / Kitchen (Basement) — large food service equipment loads
- Emergency Generator Plant (Basement) — three diesel-driven generators with paralleling switchgear and automatic transfer switching for full Essential Electrical System and Optional Standby coverage

7.3 APPLICABLE CODES AND STANDARDS

The Design-Build Entity's design shall comply as a minimum with the following codes, standards, and guidelines. Where conflicts exist, the most stringent requirement shall govern. The Contractor is responsible for determining any additional codes adopted locally in Puerto Rico at the time of permit application.

7.3.1 Federal and Local Codes

- Puerto Rico Building Code (PRBC) — incorporates by reference the 2018 International Building Code (IBC) with corresponding Puerto Rico amendments, 2018 International Fire Code (IFC) with corresponding Puerto Rico amendments, and 2018 International Energy Conservation Code (IECC) with corresponding Puerto Rico amendments, the latest editions adopted in Puerto Rico
- Puerto Rico Department of Health (PRDOH) — Hospital Licensure Regulations, including Regulation 9184
- PREPA manuals and regulations, including the Reglamento Complementario al Código Eléctrico Nacional

- Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR) — professional licensing; electrical design signed and sealed by a Puerto Rico-licensed PE who is a CIAPR member
- Americans with Disabilities Act (ADA) — 2010 ADA Standards for Accessible Design

7.3.2 NFPA Standards

- NFPA 70 — National Electrical Code (NEC), latest edition adopted in Puerto Rico — primary electrical installation standard
- NFPA 99 — Health Care Facilities Code (latest edition) — Essential Electrical System (EES), isolated power, Category 1 patient care spaces
- NFPA 72 — National Fire Alarm and Signaling Code — fire alarm system design and installation
- NFPA 101 — Life Safety Code — emergency lighting, exit signage, egress requirements
- NFPA 110 — Standard for Emergency and Standby Power Systems — emergency generators, transfer switches
- NFPA 20 — Standard for the Installation of Stationary Pumps for Fire Protection (coordination for fire pump power)
- NFPA 780 — Standard for the Installation of Lightning Protection Systems

7.3.3 NEC / NEMA / IEEE Standards

- NEC Article 517 — Health Care Facilities — essential electrical system, isolated power, patient care areas
- NEC Article 700 / 701 / 702 — Emergency, Legally Required Standby, and Optional Standby Systems
- NEC Article 230 — Services; Article 240 — Overcurrent Protection; Article 250 — Grounding and Bonding
- IEEE 241 (Gray Book) — Recommended Practice for Electric Power Systems in Commercial Buildings
- IEEE 142 (Green Book) — Recommended Practice for Grounding of Industrial and Commercial Power Systems
- IEEE 1100 (Emerald Book) — Recommended Practice for Powering and Grounding Electronic Equipment
- NEMA MG-1 — Motors and Generators (for motor-driven equipment)
- NEMA PB-1 — Panelboards
- ASHRAE 90.1 — Energy Standard (lighting power density, energy efficiency of electrical systems)

7.3.4 Healthcare Facility Guidelines

- Facility Guidelines Institute (FGI) Guidelines for Design and Construction of Hospitals — latest edition (electrical systems and patient care space requirements)
- Joint Commission Environment of Care standards (life safety and electrical system testing/maintenance)
- FAA Advisory Circular AC 150/5390-2 — Heliport Design (heliport lighting requirements)

7.4 UTILITY SERVICE AND SITE ELECTRICAL

7.4.1 38 kV Utility Feeder

The electrical utility service for the Puerto Rico Trauma Hospital shall be provided by LUMA Energy at 38 kV via an aerial service connection. The following requirements shall govern the utility interconnection:

- Voltage: 38 kV, three-phase, 60 Hz
- Service Connection: No LUMA evaluation letter currently exists for this project; the Design-Build Entity shall obtain LUMA's evaluation and approval establishing the final 38 kV point of connection, located outside the project site boundary on LUMA's existing aerial distribution system. The Design-Build Entity shall provide a complete, code-compliant transition from the LUMA point of connection to the 38 kV outdoor yard substation (see Section 4.2), including the aerial-to-underground transition, underground feeder, and necessary switching, all located within the project site and complying with PREPA rules and standards and NEC Article 230
- Preliminary Point of Connection: The preliminary point of connection for the 38 kV utility service is located south of the medical center site; this location is subject to LUMA's final evaluation and approval as described above
- Routing: The utility service infrastructure shall be routed within the project site from the point where the LUMA service enters the property to the outdoor substation yard. The LUMA point of connection itself is outside the project site boundary. The Design-Build Entity shall coordinate the final point of connection, equipment locations, route, and any LUMA-required equipment (metering, switching) with LUMA prior to design completion
- Metering: Revenue metering shall be provided per LUMA requirements at the 38 kV service entrance; all metering equipment shall be LUMA-approved and installed in a LUMA-accessible enclosure
- Coordination: The Design-Build Entity shall submit all required utility interconnection applications and load studies to LUMA and obtain LUMA approval for the service connection prior to energizing the substation

** REQUIRED: The Design-Build Entity shall meet with LUMA at project start to confirm the aerial point of connection, pole riser locations, GOAB switch location and rating, metering requirements, and the interconnection agreement. LUMA approval of the 38 kV service connection and substation design is required before construction.*

** REQUIRED: LUMA-endorsed drawings for the utility interconnection (aerial point of connection, pole risers, underground feeder, GOAB switch, and substation) shall be obtained prior to commencing site work.*

7.4.2 Outdoor Yard-Type Substation — 38 kV to 13.2 kV

The primary substation shall be an outdoor yard-type (open-air) configuration, located within the project site at grade level at a dedicated, fenced substation yard. The substation shall step down the 38 kV utility supply to 13.2 kV for distribution throughout the facility.

7.4.2.1 Transformer Configuration

- Quantity: Two (2) power distribution transformers, each rated approximately 3,750 kVA, 38 kV delta primary / 13.2 kV wye secondary, three-phase, 60 Hz — total firm capacity 7,500 kVA (2 × 3,750 kVA), providing full N+1 redundancy; either transformer alone shall carry the full facility load. The Design-Build Entity shall confirm that 3,750 kVA per unit is adequate for the complete facility electrical load calculation including all future surge capacity loads
- Type: Power distribution transformers, less-flammable liquid-filled insulating liquid per NEC 450.23; copper windings; outdoor-rated, NEMA 3R stainless steel tank and enclosure suitable for the Puerto Rico coastal/tropical environment; corrosion-resistant hardware throughout
- Voltage: Primary 38 kV delta; Secondary 13.2 kV, three-phase, grounded wye; each transformer secondary connects to the 15 kV-class primary switchgear (see Section 4.2.3), which feeds the building substation via fused load-break switches (see Section 4.3)
- Impedance: 5.75% nominal (confirm with manufacturer for fault current coordination with LUMA protective relaying and 480 V distribution circuit breakers)
- Taps: De-energized tap changer (DETC) plus or minus 2 x 2.5% on primary winding for voltage adjustment; coordinate with LUMA voltage regulation at the 38 kV delivery point
- Standards: IEEE C57.12.00 (Liquid-Immersed Distribution, Power, and Regulating Transformers — General Requirements); IEEE C57.12.10; IEEE C57.91 (Loading Guide, less-flammable liquid-immersed units); ANSI C57.12.34 as applicable
- Concrete Equipment Pads: Each transformer and all other major substation equipment (protection panels, metering cabinets, switchgear structures) shall be installed on a reinforced concrete equipment pad designed and constructed to support the equipment's weight, seismic, and wind loads, sized to accommodate the equipment footprint with adequate working clearance. Each transformer shall be provided with a spill containment curb/basin per NEC 450.23, sized for 110% of the transformer's insulating liquid volume, draining to an oil/water separator; no insulating liquid shall reach storm drains or soil.

7.4.2.2 38 kV Aluminum Structure and Primary Protection

- 38 kV Aluminum Structure: An outdoor aluminum primary support structure, conforming to PREPA Standard TM-13-2 and TM-13-3 (modified for a two-transformer configuration), shall be provided within the substation yard to support the incoming 38 kV conductors (downstream of the GOAB switch), the lightning arresters, the incoming fuse set, metering PTs/CTs, and the 46 kV fuse assembly serving each of the two transformers; each transformer is protected by a dedicated set of 46 kV-class fuses; the single pole-mounted GOAB switch (Section 4.1) and the 38 kV structure entrance fuse set together serve as the upstream switching and protection point for the substation

- Lightning arresters: One (1) set of 36 kV-class station-type lightning arresters at the incoming 38 kV structure entrance, installed downstream of the GOAB switch and upstream of the incoming fuse set, the metering PTs/CTs, and the transformer primary fuses, to protect the substation against lightning transients and switching surges
- Incoming fuse set and metering: One (1) set of 46 kV-class high-voltage power fuses shall be provided at the 38 kV structure entrance, downstream of the GOAB switch and the lightning arresters, and upstream of the metering potential transformers (PTs) and current transformers (CTs); this incoming fuse set is in addition to, and independent of, the dedicated 46 kV fuse assembly serving each transformer. Metering PTs and CTs shall be located downstream of this incoming fuse set, ahead of the branch to each transformer's 46 kV fuse assembly
- Primary overcurrent protection: 46 kV-class fuses on each transformer primary (one dedicated fuse set per transformer) sized for transformer inrush and full-load protection per LUMA requirements and the system fault current study; protective relay coordination with LUMA's upstream protective devices

7.4.2.3 15 kV Primary Switchgear

The substation shall include an outdoor 15 kV-class metal-enclosed primary switchgear lineup, located within the fenced substation yard, to receive each transformer's 13.2 kV secondary and distribute power toward the building substation. The switchgear lineup shall include the following:

- Transformer incoming switches: Two (2) load-break switches, one per transformer, connecting each transformer's 13.2 kV secondary to its respective switchgear bus section
- Tie switch: One (1) tie load-break switch, normally open, connecting the two bus sections — allowing either transformer to serve the full substation load if the other transformer or its incoming switch is out of service, matching the N+1 philosophy of the double-ended substation described in Section 4.3 and Section 5.1
- Outgoing feeders to building substation: Two (2) load-break switches with current-limiting fuses, one per bus section, feeding the two 13.2 kV underground feeders to the building substation (see Section 4.3)
- Control power: Potential transformers (PTs) shall be provided at the switchgear to derive a 120 V control/auxiliary power supply for the transformer cooling fans and substation lighting
- Auxiliary power distribution: An automatic transfer switch (ATS) and a single dedicated panelboard shall be provided to maintain continuous 120 V power to the transformer fans, substation lighting, and convenience loads
- Switchgear rating: 15 kV class, metal-enclosed, load-break switches rated for the available fault current at the 13.2 kV bus (confirmed by the fault current study); all switches lockable/padlockable in all positions; outdoor rated with a NEMA 3R stainless steel enclosure for the Puerto Rico coastal/tropical environment

7.4.2.4 Substation Yard Layout and Physical Requirements

- Fenced yard: The substation yard shall be fully enclosed with security fencing providing restricted access and a lockable access gate, meeting minimum safety clearances per NESC (National Electrical Safety Code), NEC, NFPA 70E, IEEE 1247, and PREPA Comunicado 0-2-06 from transformer enclosures, the 38 kV aluminum structure, the 15 kV primary switchgear, live parts, and fence to any accessible area
- All substation equipment pads: Reinforced concrete equipment pads, designed to support the imposed equipment, seismic, and wind loads, shall be provided for all floor-mounted equipment — transformer pads (with spill containment curb/basin per NEC 450.23), aluminum structure foundations, 15 kV switchgear bases, protection and metering panel bases, and any other free-standing equipment within the substation yard
- Service access: Service road or paved access for transformer delivery and future maintenance/replacement; transformer enclosures shall be positioned to allow removal of one unit without disturbing the other transformer or the 15 kV primary switchgear
- Hurricane and seismic design: All substation equipment, structures, transformer enclosures, and the 38 kV aluminum structure and 15 kV switchgear structures shall be designed for the project site wind loads (Category 5 hurricane, 180 mph design wind speed) and seismic loads per the Puerto Rico Building Code; all equipment shall be anchored to its concrete pad to resist the design seismic and wind loads
- Lighting: Substation yard shall have security and maintenance lighting powered from the 15 kV switchgear panelboard (Section 4.2.3); area lighting on automatic photocell controls with manual override

7.4.3 13.2 kV Feeders to Building Substation

The two 15 kV switchgear bus sections in the 38 kV substation yard (Section 4.2.3) shall each feed a dedicated 13.2 kV underground feeder to an indoor 13.2 kV-to-480 V double-ended substation located in the Building Basement Main Electrical Room. At the building substation, the two 13.2 kV feeders terminate in duplex load-break switch and fuse assemblies, providing redundancy between the two feeders; the substation transformers step down 13.2 kV to 480Y/277 V and feed the double-ended substation secondary switchgear sections described in Section 5.1. The system shall be designed as follows:

- Duplex primary switches: Two (2) duplex load-break switch and fuse assemblies, one per transformer, shall be provided at the building substation. Each duplex switch provides two incoming positions, connected to the two separate 13.2 kV feeders from the yard substation (Section 4.2.3), so that either feeder can be selected to serve either transformer; this duplex arrangement provides full two-source feeder redundancy at the 13.2 kV level — loss of one 13.2 kV feeder does not interrupt either transformer, because each can be manually switched to the surviving feeder. Each duplex switch shall include current-limiting fuses sized for transformer inrush and full-load protection, coordinated with the upstream 15 kV switchgear fused switches (Section 4.2.3) and the fault current study

- Transformers: Two (2) dry-type, VPI/VPE (Vacuum Pressure Impregnated / Vacuum Pressure Encapsulated) transformers, each rated approximately 3,750 kVA, 13.2 kV delta primary to 480Y/277 V wye secondary, three-phase, 60 Hz; copper windings; total firm capacity 7,500 kVA (2 × 3,750 kVA) providing full N+1 redundancy — either transformer alone shall carry the full facility load; minimum 6% impedance, increased above standard values due to the proximity of downstream distribution equipment and the resulting high available short-circuit currents; indoor-rated enclosure suitable for installation in the Basement Main Electrical Room; each transformer fed by its respective duplex switch above and feeding its dedicated main circuit breaker section of the double-ended switchgear (Section 5.1)
- Secondary switchgear sections: The two transformer secondaries feed a double-ended 480Y/277 V switchgear lineup consisting of two (2) electrically-operated main circuit breakers, four (4) distribution breaker sections, and one (1) electrically-operated tie breaker — see Section 5.1 for full configuration
- Two (2) independent 13.2 kV feeder runs — one per 15 kV switchgear bus section — shall be routed underground from the 38 kV substation yard to the duplex switches at the Building Basement substation; each feeder shall occupy its own separate underground manhole run, physically independent of the other feeder's manhole run, to maintain separation and redundancy between the two sources
- Feeder cables: TRXLPE (Tree-Retardant Cross-Linked Polyethylene)-insulated medium-voltage shielded power cable (15 kV class) rated for underground direct-burial/duct bank service; single-conductor sets per phase in conduit; cable size determined by the Design-Build Entity based on load calculation, voltage drop (maximum 2% on secondary feeders), and short-circuit rating; ICEA/NEC-compliant ampacity per NEC Article 310
- Underground duct bank and manholes: Concrete-encased PVC conduit duct bank for each 13.2 kV feeder, routed from the 38 kV substation yard 15 kV switchgear to the Building Basement substation room wall penetration; separate underground manholes shall be provided for each of the two feeders (no shared manhole between the two feeders); minimum one (1) spare conduit per feeder duct bank for future use; duct bank and manhole design per NEC and ACI 318 for the project seismic zone; conduit entry into the electrical room via sleeve with fire-stopping seal
- Fault current: The Design-Build Entity shall perform a complete fault current study at the 13.2 kV building substation primary and at the 480 V switchgear bus (with both transformers contributing) to determine the available short-circuit current and size all switches, circuit breakers, bus bars, and cables for the available fault level; fault current study to be submitted at DD phase

7.5 NORMAL POWER DISTRIBUTION

Normal power distribution for the facility is 13.2 kV primary (Section 4.3) stepped down to 480Y/277 V secondary within the Building Basement double-ended substation; the double-

ended substation secondary switchgear sections (Section 5.1) distribute power to the corresponding Automatic Transfer Switches (Section 6.2).

7.5.1 Double-Ended Substation Secondary Switchgear Sections

The two Building Basement substation transformer secondaries (Section 4.3) connect via bus bars to a secondary switchgear assembly: a 480Y/277 V metal-enclosed lineup of seven (7) sections, comprising two main breakers, a tie breaker, and four distribution breaker sections feeding the Automatic Transfer Switches of the four load systems; located in the Basement Main Electrical Room.

7.5.1.1 Switchgear — Overall Configuration

- Assembly: One (1) metal-enclosed low-voltage switchgear lineup consisting of seven (7) main sections in the following left-to-right order: Main Breaker Section 1 — Distribution Section 1 — Distribution Section 2 — Tie Breaker Section — Distribution Section 3 — Distribution Section 4 — Main Breaker Section 2
- Voltage: 480Y/277 V, three-phase, four-wire, 60 Hz; solidly grounded wye secondary system
- Bus Rating: Copper bus bars; minimum 5,000 A continuous rating per bus section (confirm based on load calculation); bus fully braced for the available short-circuit current determined by the fault current study; bus bars silver-plated at all joints
- Concrete Equipment Pad: The entire switchgear lineup shall be installed on a continuous reinforced concrete housekeeping pad running the full length of the assembly, designed to support the equipment load and provide adequate working clearance on each side

7.5.1.2 Main Circuit Breakers — Electrically Operated (x2)

- Quantity: Two (2) main circuit breakers — Main Breaker 1 (MB-1) at the left end of the lineup feeding Bus 1 from Transformer 1, and Main Breaker 2 (MB-2) at the right end feeding Bus 2 from Transformer 2
- Type: Power circuit breaker (PCB); electrically operated (EO) — motorized stored-energy charging mechanism with electrical close and electrical trip operators; remote racking in/out capability
- Rating: Frame and trip rating sized by the Design-Build Entity to match transformer full-load current (3,750 kVA at 480 V = approximately 4,510 A full load); minimum 5,000 A frame; 100% continuous duty rating
- Trip Unit: Fully electronic, microprocessor-based trip unit with independently adjustable Long-Time (LT), Short-Time (ST), Instantaneous (INST), and Ground Fault (GF) protection functions; trip unit with Zone Selective Interlocking (ZSI) capability to coordinate with downstream feeder breakers
- Ground Fault Protection: Ground fault protection (GFP) per NEC 230.95 and NEC 517.17 on each main breaker; GFP coordinated in time with downstream branch and feeder protective devices to minimize nuisance tripping in the healthcare environment

- Electrical Operation: Each main breaker shall be furnished with a motorized spring-charging mechanism and AC/DC electrical close and trip coils for remote/automatic operation
- Anti-Pumping and Keyed Interlocks: Anti-pumping relay; mechanical and electrical interlocking with the Tie Breaker (TB) to enforce the standard double-ended closed-bus or open-tie operating modes and prevent parallel operation of both transformers unless specifically enabled

7.5.1.3 Tie Breaker — Electrically Operated

- Quantity: One (1) bus tie circuit breaker (TB) located in the center Tie Breaker Section of the lineup, connecting Bus Section 1 and Bus Section 2
- Type: Same family as the main breakers; power circuit breaker; electrically operated (EO) — motorized stored-energy mechanism with electrical close and trip operators
- Rating: Same frame and trip rating as the main breakers; must be capable of carrying the full Bus 1 or full Bus 2 load individually when operating in open-bus / single-ended mode (one main open, tie closed)
- Trip Unit: Fully electronic microprocessor-based trip unit matching the main breakers; ZSI capability; LT/ST/INST/GF settings coordinated with main breakers and downstream feeders
- Normal Operating Mode: Tie Breaker NORMALLY OPEN; both main breakers NORMALLY CLOSED; Bus 1 served by Transformer 1 and Bus 2 served by Transformer 2 simultaneously (split-bus, open-tie operation); loads distributed across both buses to balance transformer loading
- Automatic Transfer: The Design-Build Entity shall provide an automatic bus transfer (ABT) scheme: upon failure of one incoming transformer or main breaker, the corresponding bus main breaker opens automatically, the Tie Breaker closes automatically (within the transfer time required by NFPA 99 for the loads served), and the surviving transformer/main breaker feeds both buses via the Tie Breaker; ABT shall include time delay, voltage supervision, and anti-paralleling interlocks; coordinate with LUMA and the EES ATS transfer scheme
- Manual Operation: Tie Breaker shall also be operable manually (local pushbutton on door) with operator-visible bus voltage indication to verify source before closing; key interlock scheme to enforce correct switching sequence

7.5.1.4 Distribution Breaker Sections (x4)

- Quantity: Four (4) distribution breaker sections — Distribution Sections 1 and 2 (adjacent to Main Breaker Section 1, serving Bus 1) and Distribution Sections 3 and 4 (adjacent to Main Breaker Section 2, serving Bus 2) — two distribution sections per transformer/bus
- Feeder Circuit Breakers: Circuit breakers, draw-out type, electrically operated (EO), for each outgoing feeder to an Automatic Transfer Switch (Section 6.2); each breaker with electronic trip unit sized and coordinated per the protective device coordination study
- Load-Category Feeder Breakers: Each of the four distribution breaker sections shall include the dedicated feeder breaker for one of the four load categories — Life Safety,

Critical, Equipment System, and Optional Standby (Non-Essential); all feeder breakers in the distribution sections shall serve the load-category Automatic Transfer Switches. The emergency-source (generator) input of each ATS is fed from the corresponding distribution breaker at the generator paralleling switchgear (Section 6.1.2)

- Bus Rating: Each distribution bus section rated to match the main bus — 5,000 A; copper bus bars silver-plated at joints
- Metering: Multi-function power metering on each bus section — kW, kWh, kVAR, kVA, power factor, voltage (all phases), current (all phases), THD — integrated with the Building Management System (BMS) for real-time energy monitoring, demand management, and transformer load balancing reporting
- Ground Fault Protection: Ground fault protection per NEC 517.17 on all feeder circuit breakers serving patient care areas; GFP settings coordinated in a selective, time-graded scheme with the main breaker GFP to prevent loss of the entire bus on a downstream ground fault
- Arc Flash Labeling: All switchgear sections and circuit breaker compartments shall be labeled with arc flash incident energy, flash protection boundary, and required PPE per NFPA 70E / IEEE 1584; arc flash hazard analysis required at DD phase

7.5.2 480 V Mechanical Equipment Power

- Mechanical equipment power: AHUs, cooling tower fans, pumps, and fire pumps shall be served from 480 V panelboards with individual combination starters or variable frequency drives (VFDs) and disconnect means at each piece of equipment; VFDs shall be supplied by the Mechanical Contractor
- VFD Integration: All VFDs (chilled water pumps, condenser water pumps, cooling tower fans, AHU fans, DOAS units, booster pumps) shall be furnished by the Mechanical Contractor and shall receive power from the corresponding 480 V panelboard with properly sized feeders provided by the D&B Electrical Contractor; VFDs shall be supplied with appropriate input/output reactors/filters for harmonic mitigation
- Equipment labeling: All switchgear, panelboards, and disconnect switches shall be labeled per NEC and NFPA 70E with voltage, circuit designation, and arc-flash incident energy
- Provide a double throw switch and a tap box with cam connectors for a portable chiller.

7.5.3 Panelboards and Branch Circuits

- Step-down transformers: 480-120/208 V dry-type, copper-wound, copper-wound K-rated transformers for all 120/208 V panelboards; transformer kVA sized for panelboard load
- Panelboard arrangement: Electrical rooms per floor per Section 5.4; each electrical room to house both an optional (non-essential) power panelboard and an essential power panelboard
- Branch circuits: All patient care areas wired per NEC Article 517; minimum number of receptacles and circuit spacing per FGI Guidelines and NFPA 99; hospital-grade receptacles (NEMA 5-20R) in all patient care spaces

- Isolated Ground circuits: Isolated ground receptacles (orange) at nursing stations, imaging equipment, and other sensitive electronic equipment locations as required
- GFCI protection: GFCI receptacles in all wet locations, patient bathrooms, scrub sinks, janitor rooms, and exterior locations per NEC
- Tamper-Resistant receptacles (TR): Per NEC 406.12, tamper-resistant receptacles shall be provided in pediatric patient care rooms or locations, corridors, waiting rooms, and similar areas

7.5.4 Electrical Rooms

- Basement Main Electrical Room: Houses the double-ended substation (Section 4.3), including its secondary switchgear sections (Section 5.1 — two electrically-operated main breakers, tie breaker, and four distribution breaker sections), the total Automatic Transfer Switches required to serve the four load systems — Life Safety, Critical, Equipment System, and Optional Standby (Sections 6.2, 6.3.5), with more than one ATS permitted per system — main distribution panelboards, dry-type transformers, and 120/208 V panelboards; room shall be sized with NEC-required maintenance clearances and for future expansion; all floor-mounted equipment shall be installed on reinforced concrete housekeeping pads
- Generator Room: Dedicated Basement room housing the three (3) diesel generators (Section 6.1); two-hour fire-rated construction, dedicated combustion air intake and exhaust routing, exhaust discharge coordinated away from air intakes and the heliport approach/landing zone
- Paralleling Switchgear Room: Separate Basement room adjacent to, but not within, the Generator Room; houses the generator paralleling switchgear (Section 6.1.2)
- Floor Electrical Rooms: Floor electrical rooms shall house 480Y/277 V panelboards, dry-type transformers, and 120/208 V panelboards. In addition to the Main Electrical Room, Generator Room, and Paralleling Switchgear Room, the Basement shall be provided with three (3) additional electrical rooms; the First (Ground) Floor shall be provided with four (4) electrical rooms; Levels 2 through 8 shall each be provided with three (3) electrical rooms per floor; Level 9 shall be provided with two (2) electrical rooms. Rooms shall be sized to accommodate both optional (non-essential) and essential panelboards, step-down transformers, and required maintenance clearances
- All electrical rooms: Two-hour fire-rated construction (NEC 700.10, NFPA 99); dedicated ventilation (no water piping above electrical equipment); floor drains not permitted (coordinate with mechanical); housekeeping pads for all equipment; rated for the available fault current

7.6 EMERGENCY AND STANDBY POWER SYSTEMS

The facility shall be classified as a Category 1 healthcare occupancy per NFPA 99. The Essential Electrical System (EES) shall be designed, installed, and tested in full compliance with NFPA 99 (Health Care Facilities Code) and NEC Article 517, and shall provide reliable

emergency power to all life-safety and critical clinical loads. An Optional Standby System, complying with NEC Article 702, shall also be provided for non-essential loads as described in Section 6.3.5. The emergency generator plant shall provide full building coverage, backing 100% of the building load across all load categories — there shall be no normal-only (unbacked) building loads.

7.6.1 Emergency Generators

- Quantity: Three (3) diesel engine-driven generator sets, each rated 1,750 kW standby, 480Y/277 V, three-phase, four-wire, 60 Hz. The emergency generator plant shall cover 100% of the building load — i.e., all four load categories (Life Safety, Critical, Equipment System, and Optional Standby) are connected to generator backup, with no normal-only (unbacked) building loads. Two (2) of the three generators, operating in parallel, shall be sized to independently carry 100% of this total connected building load; the third generator is a spare, providing N+1 redundancy at the generator level. The three generators shall alternate in rotation (lead/lag/spare assignment rotated on a scheduled basis) so that running hours are equalized across all three units over time
- Capacity: Total installed generator capacity 3 × 1,750 kW = 5,250 kW; normal redundant operating capacity with any two units paralleled = 3,500 kW, sized to carry 100% of the total building load (all four load categories). The Design-Build Entity shall confirm by complete building load calculation (ORs, ICUs, Trauma Stabilization, Emergency Department, imaging, heliport, fire alarm, nurse call, Disaster Control Center, elevators, lighting, medical gas compressors and vacuum, BMS/IT infrastructure, mechanical/HVAC equipment, and all Optional Standby (non-essential) loads) that 3,500 kW of paralleled capacity is adequate to cover 100% of building load, including motor starting inrush and future surge capacity
- Voltage Output: 480Y/277 V, three-phase, four-wire, 60 Hz; all three generators shall be capable of paralleling onto a common bus via the paralleling switchgear (see Section 6.1.2)
- Fuel and day tanks: Ultra-low-sulfur diesel (ULSD); one (1) freestanding day tank per generator, located in the generator room; day tank capacity shall be the maximum permitted indoor volume per NFPA 30, NFPA 37, NFPA 110, and the AHJ, with remote fill and overfill protection, leak detection, and spill containment
- Bulk Diesel Storage and Supply: A building main diesel storage tank shall be provided with a minimum 5-day (120-hour) full-load reserve capacity, sized per the Design-Build Entity's fuel consumption calculation for the installed generator capacity; coordinate fuel piping, day tank fill pumps, tank venting, spill containment, and leak detection per NFPA 30 and NFPA 110. In addition, the Owner shall maintain a contracted diesel resupply agreement guaranteeing delivery sufficient to sustain a minimum 20-day full-load operating capacity, supplementing the 5-day on-site main tank reserve
- Starting: Automatic start on loss of normal utility power; generators shall reach rated voltage and frequency and be ready to accept load within 10 seconds per NFPA 110 Level 1
- Engine: Turbocharged diesel, EPA Tier 2 compliant or as accepted by AHJ
- Enclosure/Location: All three generators shall be housed in a dedicated generator room in the Basement with proper ventilation, combustion air intake, and exhaust routing; room

shall have two-hour fire-rated construction, exhaust silencers, flexible exhaust connectors, and vibration isolation pads; coordinate exhaust discharge location away from air intakes, occupied areas, and heliport approach/landing zone. The paralleling switchgear (Section 6.1.2) shall be located in a separate room adjacent to the generator room, not within the generator room itself

- Acoustic Treatment: Sound attenuation shall be provided at the generator room walls and ceiling, gravity louvers, wall (intake) louvers, and the radiator discharge canvas (flexible duct connector), to limit noise transmission to adjacent occupied spaces and the building exterior, per the project's acoustic design criteria and applicable local noise ordinances
- Controls: Generator control panels with automatic start/stop, paralleling controls via the paralleling switchgear, automatic load shedding on overload, run-hour equalization/rotation logic to alternate lead, lag, and spare assignment among the three units, BMS integration for remote monitoring of generator status, kW output, fuel level (day tank and main tank), coolant temperature, battery status, and alarm annunciation
- Testing: Generators shall be exercised under load monthly; full-load bank testing at project closeout and annually thereafter; remote monitoring required
- Generators remote annunciator to be provided at Security/Fire Command Center Room. The remote annunciator to be storage battery operated and hardwired as per NFPA99 (Section 6.7.1.2.7).

7.6.1.1 Paralleling Switchgear

The three (3) emergency generators shall connect to a dedicated paralleling switchgear assembly located in a separate, two-hour fire-rated room adjacent to the generator room (not within the generator room itself). The paralleling switchgear shall synchronize and parallel the three generators onto a common bus, then distribute generator power to twelve (12) separate distribution breakers — eleven (11) serving the Optional Standby (Non-Essential) load category and the three NFPA 99 Essential Electrical System (EES) branches, each routed to its corresponding Automatic Transfer Switch (ATS) located in a Main Electrical Room adjacent to the double-ended substation in the Building Basement (Section 6.2), and one (1) dedicated load bank breaker for periodic generator load testing.

- Generator breakers: One (1) electrically operated, draw-out or fixed-mount generator output breaker per generator (3 total), each with synchronizing controls, reverse power/loss of field protection, and interlocking to prevent out-of-phase paralleling
- Bus configuration: Single common paralleling bus, rated for the full output of all three generators operating in parallel (3 × 1,750 kW); bus shall be sized and braced for the available fault current with all three generators contributing
- Distribution breakers — Life Safety Branch: One (1) electrically operated breaker feeding the emergency-source input of the Life Safety Branch ATS(s) (Section 6.3.1)
- Distribution breakers — Critical Branch: One (1) electrically operated breaker feeding the emergency-source input of the Critical Branch ATS(s) (Section 6.3.2)
- Distribution breakers — Equipment System: Two (2) electrically operated breakers feeding the emergency-source input of the Equipment System ATS(s) (Section 6.3.3)

- Distribution breakers — Optional Standby (Non-Essential): seven (7) electrically operated breakers feeding the emergency-source input of the Optional Standby ATS(s) (Section 6.3.5). This branch is governed by NEC Article 702 (Optional Standby Systems) and is distinct from the three NFPA 99 EES branches above — it serves non-essential building loads (e.g., general office, food service, non-clinical support areas) that the Owner has elected to place on generator backup
- Load Bank breaker: One (1) breaker dedicated to connection of a permanent or portable load bank, enabling periodic generator testing under load per NFPA 110
- Controls: Automatic synchronizing and load-sharing controls; load-shed/load-add logic to protect against generator overload if fewer than three units are online; BMS integration for breaker status, bus voltage/frequency, and load on each distribution breaker
- Protective relaying: Microprocessor-based multifunction relays on the generator breakers and bus, coordinated with the distribution breakers, per IEEE C37.2 and NFPA 110

** REQUIRED: The Design-Build Entity shall perform a complete EES load calculation and confirm final generator kW ratings at Schematic Design phase. Generator sizing shall account for motor starting inrush, VFD loads, harmonic loads, and future surge capacity.*

7.6.2 Automatic Transfer Switches (ATS)

- A minimum of one Automatic Transfer Switch (ATS) shall be provided for each of the four (4) load categories: Life Safety Branch, Critical Branch, Equipment System, and Optional Standby (Non-Essential) System. Any of the four categories may be further subdivided into multiple ATS units serving individual loads or load groupings within that category (e.g., a dedicated ATS per elevator or other major piece of equipment within the Equipment System category) as determined by the Design-Build Entity's load calculation and equipment layout. Each ATS, regardless of subdivision, shall have a normal-source input fed from its corresponding load-category breaker/subfeed at the double-ended substation distribution sections (Section 5.1.4) and an emergency-source input fed from its corresponding distribution breaker/subfeed at the generator paralleling switchgear (Section 6.1.2); Life Safety Branch and Critical Branch ATS units shall transfer to generator power within 10 seconds per NEC Article 700 and NFPA 99, respectively
- ATS Type: Automatic transfer switches; open-transition (break-before-make) transfer; furnished with an external manual operator; 4-pole (switched neutral) construction where a neutral conductor is required
- Separate ATSs shall be provided for the Life Safety Branch and the Critical Branch per NFPA 99 / NEC Article 517 — these branches shall not be combined on a single ATS
- Number and location: The total Automatic Transfer Switches required to serve the four load systems (Life Safety, Critical, Equipment System, and Optional Standby) shall be located in the Basement Main Electrical Room adjacent to the double-ended substation (Section 4.3); more than one ATS may be provided per system. All ATS units, including any additional units serving a given system, shall be located in the Basement Main Electrical

Room; downstream subdistribution from each ATS shall extend to floor electrical rooms as required to minimize feeder lengths and maintain branch separation per NFPA 99

- Equipment System and Optional Standby subdivision: Large motor and large equipment loads may each be served by their own dedicated, individually-sized ATS rather than a single shared ATS — large HVAC equipment such as chillers within the Optional Standby System, and elevators within the Equipment System category — allowing independent time-delayed starting/sequencing per piece of equipment and simplifying future load additions; regardless of subdivision, time-delay contactors and sequencing controls shall be provided to prevent generator overload

7.6.3 Essential Electrical System (EES) — NFPA 99 / NEC 517

The Essential Electrical System shall be designed in strict conformance with NFPA 99 Category 1 and NEC Article 517, as applicable to a general hospital. The EES shall comprise three separate and distinct branches. A fourth, separate Optional Standby System (Section 6.3.5), governed by NEC Article 702 and distinct from the NFPA 99 EES, shall serve designated non-essential building loads from the same generator plant:

7.6.3.1 Life Safety Branch

- Illumination of exits, exit signs, exit corridors, stairways, and means of egress lighting
- Alarm and alerting systems — fire alarm system (all circuits), medical gas master alarms
- Generator control and communications
- Paging and public address system serving means of egress
- Elevator cab lighting, controls, and communications
- Emergency communication systems

7.6.3.2 Critical Branch

- Patient care areas: Receptacles and fixed equipment in ORs, Trauma ICU, Trauma Stabilization, ED, and all Category 1 patient care spaces
- Task illumination in ORs, procedure rooms, ICU rooms, Trauma Stabilization, medication preparation areas, nurses' stations
- Isolated power panels (IPP) in ORs — Critical Branch IPP serving life-critical patient care equipment in each OR per NFPA 99 / NEC 517.160 (see Section 6.3.4 for the companion Optional Standby IPP)
- Nurse call system
- Heliport lighting (FAA required)
- Disaster Control and Monitoring Center — UPS and essential power
- Blood bank refrigerators, medication refrigerators, and critical laboratory equipment
- Communication systems at nursing stations, patient rooms, and key clinical areas

7.6.3.3 Equipment System (Delayed Automatic or Manual Connection)

- Selected elevators; supply, return, and ventilating systems for operating, delivery, and isolation rooms; oxygen plant
- Sump pumps, elevator motors (non-life-safety)

- Medical gas compressors and vacuum pumps
- Central sterile supply and other major clinical support equipment

7.6.3.4 Isolated Power Panels (IPPs) — Operating Rooms

Each of the five (5) Trauma Operating Rooms shall be served by two (2) dedicated Isolated Power Panels (IPPs) per NFPA 99 and NEC 517.160 — one fed from the Optional Standby (Non-Essential) branch and one fed from the Critical Branch. Each isolated power system (IPS) shall provide an ungrounded power supply for patient care equipment within the OR, with continuous ground fault monitoring via a dedicated Line Isolation Monitor (LIM) for each panel.

- Each of the two IPPs (Optional Standby IPP and Critical Branch IPP) shall include its own isolation transformer (120/208 V, ungrounded secondary, copper windings), its own Line Isolation Monitor (LIM) with a remote hazard current indicator and audible/visual alarm at the OR entrance, and the branch circuit panelboard for the OR receptacles and equipment assigned to that branch
- Each LIM shall monitor both legs of its respective isolated circuit continuously; alarm shall annunciate — but NOT de-energize the circuit — when total hazard current exceeds 5 mA; this allows surgery to continue safely while the fault is located
- Each LIM alarm shall be integrated into the nurse call/OR control system and reported to the BMS, identified by branch (Optional Standby IPP or Critical Branch IPP)
- Isolated power receptacles in each OR shall be clearly labeled by source branch — Optional Standby IPP or Critical Branch IPP; life-critical patient care equipment circuits shall be assigned to the Critical Branch IPP, while non-life-critical OR equipment may be assigned to the Optional Standby IPP at the Design-Build Entity's discretion in coordination with the Owner's clinical/biomedical staff

7.6.3.5 Optional Standby System (Non-Essential Loads)

In addition to the three NFPA 99 Essential Electrical System branches above, an Optional Standby System shall be provided per NEC Article 702 to serve designated non-essential building loads from the shared generator plant. This system is electrically and administratively distinct from the EES — it is not part of the NFPA 99 Category 1 Essential Electrical System and shall not be combined with EES branch wiring or panels.

- Loads served: General office areas, administrative spaces, food service and kitchen equipment, chillers, non-clinical support areas, and other Owner-designated non-essential loads as identified during the EES/Optional Standby load calculation
- Source: Fed from the dedicated Optional Standby distribution breakers at the paralleling switchgear (Section 6.1.2); transferred via the Optional Standby ATS located in the Main Electrical Room adjacent to the double-ended substation (Section 6.2)
- Priority: Optional Standby loads are the lowest priority on the generator plant; the paralleling switchgear load-shed logic shall shed Optional Standby loads first in the event of a generator failure or overload condition affecting EES capacity

- Wiring and distribution: Optional Standby panelboards, feeders, and branch circuits shall be physically and electrically separated from EES wiring per NEC 700.10 and NFPA 99; clearly labeled as "Optional Standby — Non-Essential" at all panels and disconnects

7.6.4 Uninterruptible Power Supply (UPS)

- A centralized UPS system (or distributed UPS systems) shall be provided for the following critical loads requiring zero-transfer-time power continuity:
  - Disaster Control and Monitoring Operations Center (Level 9) — UPS for all computers, servers, communications, CCTV, BMS workstations, and monitoring equipment; minimum 30-minute runtime at full load (extend to 60 minutes if feasible)
  - Hospital Information System (HIS) / Electronic Health Records (EHR) servers and network infrastructure — if a central server room/IT room is provided within the facility
  - Critical monitoring equipment — patient monitoring systems where applicable (coordinate with Owner's medical equipment procurement)
  - Fire alarm system control panels and network communications (if not battery-backed per NFPA 72 within panels)
- UPS Type: On-line double-conversion (VFI — Voltage and Frequency Independent) per IEC 62040-3; provides continuous clean power with zero transfer time on utility or generator failure
- UPS Configuration: N+1 redundant UPS modules within each UPS system; static bypass and manual bypass for maintenance without interruption to critical loads
- Battery: Sealed VRLA (valve-regulated lead-acid) or lithium-ion batteries; battery monitoring integrated into BMS for battery health, state of charge, and estimated runtime reporting

7.7 GROUNDING AND BONDING

A comprehensive facility grounding and bonding system shall be designed and installed per NEC Article 250, IEEE 142, and the special requirements of NEC Article 517 for healthcare facilities and NFPA 99 for patient safety. The grounding system shall provide a safe and low-impedance ground fault return path, limit step and touch potentials, protect equipment from lightning and transient overvoltages, and maintain the equipotential plane required in patient care areas.

- Building Ground Grid: A copper ground grid or ring shall be installed below grade around and beneath the building footprint, connected to ground rods per NEC 250.50 and IEEE 142
- Substation Ground Grid: An outdoor substation ground grid shall be designed per IEEE 80; the combined grid resistance shall not exceed the value required by LUMA and IEEE 80 for the available fault current
- Indoor Substation Ground Ring: A ground ring shall be provided for the indoor substation, interconnected to the building ground ring

- Equipment Grounding: All metallic equipment enclosures, raceways, cable trays, transformer tanks, and generator housings shall be bonded to the building grounding system
- Patient Care Areas — Equipotential Bonding: In all Category 1 patient care spaces (ORs, ICU rooms, Trauma Stabilization cubicles, patient rooms), all exposed conductive surfaces within the patient care vicinity — including medical equipment frames, metallic components of fixed and movable conductive equipment, and metal surfaces that could contact a patient — shall be bonded to the reference grounding point per NFPA 99 and NEC 517.13
- Patient Equipment Grounding Point (PEGP): A Patient Equipment Grounding Point shall be provided at the head wall/bed location in each ICU, OR, and Trauma Stabilization station for bonding of portable patient equipment
- Isolated Power System Grounding: The isolated (ungrounded) secondary of each OR isolated power panel (IPP) shall NOT be grounded; the equipment grounding conductor shall connect the IPP equipment enclosure to the reference grounding point per NEC 517.160 and NFPA 99
- Telecommunications / Surge Protection: Surge protection devices (SPDs) shall be provided at the main service entrance incoming terminals of the double-ended substation secondary switchgear sections (Type 1), at each ATS downstream bus, and at each distribution panelboard and step-down transformer secondary serving sensitive electronic and medical equipment (Type 2); SPDs UL 1449 listed throughout
- Lightning Protection: See Section 11

7.8 LIGHTING SYSTEMS

7.8.1 Interior Lighting

The interior lighting system shall be designed to meet the illuminance levels, color rendering, and controllability requirements of the Illuminating Engineering Society (IES) Handbook, IES RP-29-20 (Lighting for Hospitals and Healthcare Facilities), and the FGI Guidelines for hospital facilities, while meeting the lighting power density (LPD) limits of ASHRAE 90.1 for energy compliance.

- Light Sources: LED throughout the facility; high Color Rendering Index (CRI ≥ 90) in all patient care areas; tunable white LED (correlated color temperature 2,700–6,500 K adjustable) in ORs, ICU rooms, and Trauma Stabilization areas for clinical task accuracy
- Luminaire Types: Recessed lay-in for administrative and support spaces; recessed for corridors; sealed luminaires with a flat, wipe-down surface for easy cleaning in patient rooms and patient care areas; recessed/surface in public spaces; vapor-tight in mechanical and electrical rooms; IP65-rated sealed luminaires in surgical suites and trauma rooms

Space Type	Target Illuminance	Notes
Trauma OR — General (at floor)	200 fc (2000 lux)	Controlled via dimming; separate surgical field lighting by Owner equipment
Trauma OR — Surgical Field	≥ 2,000 fc	Owner-furnished surgical lights; power and supports by Design-Build Entity
Trauma ICU — Patient Area	30 fc (300 lux)	Dimmable; night mode ≤ 1 fc
Trauma Stabilization Cubicle	50 fc (500 lux)	Task lighting; dimmable
Imaging — CT / X-Ray Room	30–50 fc	Dimming required during imaging procedures
Patient Room — General	20 fc (200 lux)	Dimmable; exam mode ≥ 50 fc; night mode ≤ 1 fc
Nursing Station	50 fc (500 lux)	At counter height; supplemental task lighting
Administrative / Offices	35–50 fc (350–500 lux)	Per ASHRAE 90.1 zone control
Corridors — Clinical	10–30 fc	Minimum 10 fc maintained; night mode available
Mechanical / Electrical Rooms	30 fc (300 lux)	Industrial/utility luminaires
Stairways	10 fc (100 lux)	Essential branch; emergency backup
Cafeteria / Lobby	30–50 fc (300–500 lux)	Decorative/architectural lighting by D&B

7.8.2 Emergency and Exit Lighting

- Emergency lighting shall be provided per NFPA 101 and NEC Article 700 throughout all means of egress, including exit stairways, corridors, lobbies, and exterior exits; minimum 1 fc maintained on the egress path
- Exit signs: LED combination illuminated exit signs with battery backup (90-minute minimum); illuminated from Life Safety Branch or integral battery per NEC 700
- Battery unit equipment: Emergency lighting units with integral sealed batteries (90-minute rating) may supplement the Life Safety Branch circuits in areas where circuit routing is impractical; all units shall comply with UL 924
- Patient care areas: Emergency task lighting in ORs, ICU, and Trauma Stabilization shall be powered from the Essential Electrical System Critical Branch — not from battery units — to ensure continuous, full-illuminance task lighting during extended outages

7.8.3 Exterior and Site Lighting

- Site and service parking area lighting: LED pole-mounted area lights on photocell + time clock controls
- Building façade / architectural lighting: Coordinate with architectural design intent
- Ambulance entrance: High-illuminance area lighting (≥ 30 fc) at the ambulance drop-off, trauma bay entrance, and emergency department entrance; essential branch powered
- All exterior luminaires: IP65 rated; hurricane-rated mounting (wind load per ASCE 7 / PRBC for Puerto Rico); corrosion-resistant housings (marine-grade aluminum or stainless steel components) for coastal environment

7.8.4 Heliport Lighting

The Roof Level heliport shall be provided with FAA-compliant lighting systems per FAA Advisory Circular AC 150/5390-2. All heliport lighting shall be powered from the Essential Electrical System Critical Branch — power continuity is required for night-time and instrument flight rule (IFR) medevac operations.

- Perimeter lights: FAA-compliant flush-mounted or low-profile omnidirectional white/yellow lights at the perimeter of the Final Approach and Takeoff (FATO) area; spacing and photometric output per AC 150/5390-2
- Touchdown/Liftoff (TLOF) area lights: FAA-compliant TLOF edge or in-pavement lights in white/green around the landing pad
- Windsock / wind indicator: Lighted windsock mounted on an FAA-approved support structure at the heliport level; illuminated at night from essential branch
- Obstacle/obstruction lighting: FAA-required red obstruction lights on any rooftop mechanical equipment, structures, or antenna masts that penetrate the FAA-defined heliport obstacle clearance surface; coordinate with FAA airspace review
- Flood lighting: Supplemental flood/area lighting of the heliport pad and access path for night operations
- Controls: Heliport lighting shall be controlled from the Disaster Control Center (Level 9) and from a local control panel at the heliport level; pilot-activated lighting (PAL) radio control may be considered

7.8.5 Lighting Controls

- Centralized lighting control system: A digitally-addressable lighting control system (DALI, DMX, or equivalent open-protocol system) shall be provided for all clinical, administrative, and common areas; integrated with the BMS for monitoring and energy reporting
- Occupancy sensors: Ceiling-mounted ultrasonic or dual-technology sensors in offices, conference rooms, and support spaces for automatic shutoff; sensor-based control per ASHRAE 90.1 requirements for each space type
- Daylight harvesting: Photosensor-based daylight dimming control for perimeter spaces with significant natural light (administrative floors, lobbies); dimming ballasts/drivers per ASHRAE 90.1

- Dimming: All clinical areas (ORs, ICU, patient rooms, procedure rooms) shall have smooth, continuous dimming capability from 100% to ≤ 1% for patient sleep/night mode and procedure-specific illuminance levels
- Time scheduling: Central time clock programming for exterior, site, and non-24-hour spaces; local override at wall stations
- Code Compliance: Lighting power density per ASHRAE 90.1 Table 9.6.1 (Space-by-Space Method) for all spaces; automatic shutoff per ASHRAE 90.1 Section 9.4.1

7.9 COMMUNICATIONS AND DATA SYSTEMS

7.9.1 Telecommunications Infrastructure

Structured cabling (the actual cable installation, terminations, patch panels, and active network equipment) is not in the Design-Build Entity's contract scope and shall be provided under a separate Owner contract. The Design-Build Entity shall design and install the rough-in infrastructure only — pathways, conduit, cable tray, and dedicated room/space provisioning — per ANSI/TIA-569 (Pathways and Spaces), sized and routed to accommodate the Owner's structured cabling installer.

- Main Telecommunications Room (MTR): Locate in the Basement near the main electrical room; this is the building's main point of entry for all external telecommunications services (internet, telephone, private fiber from ASEM building) (room and pathway provisioning by Design-Build Entity; rack/equipment installation by Owner's structured cabling contractor)
- Point of Connection: Preliminary point of connection for telecommunications service is a manhole located north of the project site; final point of connection and service requirements shall be as determined by the Junta Reglamentadora de Telecomunicaciones de Puerto Rico (JRTC). The Design-Build Entity shall coordinate evaluation and endorsement of the connection with the corresponding telecommunications service provider/agency
- Telecommunications Rooms (TRs): One (1) TR per floor minimum, consistent with the two electrical rooms per floor arrangement; additional TRs shall be provided throughout the facility as necessary to meet the 292 ft maximum cable distance required for Ethernet cabling from the termination point at the TR to each wall outlet; TRs to house patch panels, network switches, and floor-level communications equipment; TRs sized per TIA-569 with adequate power, cooling (dedicated mini-split or served by HVAC), and UPS-backed power; Design-Build Entity scope is limited to room provisioning, sizing, and pathway connections — patch panels, network switches, and other active equipment are furnished and installed by the Owner's structured cabling contractor
- Horizontal cabling pathway: Design-Build Entity shall provide cable tray above ceilings and EMT conduit stub-outs in walls sized for Category 6A (10 GbE capable) UTP or F/UTP cabling from TRs to all data/voice outlet locations; the cabling itself, terminations, and outlet jacks are not in the Design-Build Entity's scope and shall be furnished and installed by the Owner's structured cabling contractor

- Backbone cabling pathway: Design-Build Entity shall provide ladder-type cable trays from MTR to each TR sized to accommodate fiber optic backbone cabling for both data (hospital network) and telephone/voice systems; the fiber cabling itself is not in the Design-Build Entity's scope and shall be furnished and installed by the Owner's structured cabling contractor
- Outlet rough-in: Design-Build Entity shall provide outlet boxes and conduit stub-outs for a minimum of two (2) data/voice outlet locations per patient room, per workstation, and per nursing station location, with additional locations at imaging, ORs, and special areas per program; faceplates, jacks, and cable terminations are not in the Design-Build Entity's scope and shall be furnished and installed by the Owner's structured cabling contractor
- Cable TV (CATV) rough-in: Design-Build Entity shall provide outlet boxes and conduit stub-outs for CATV provisioning at waiting areas and patient rooms; coaxial cabling, splitters/taps, and active CATV head-end equipment are not in the Design-Build Entity's scope and shall be furnished and installed by the Owner's structured cabling/CATV contractor
- Wireless: While the Design-Build Entity's scope is the wired infrastructure, coordination for wireless access point (WAP) locations and rough-in pathway (homerun conduit/cable tray to each WAP location) shall be included; the homerun cabling itself is not in the Design-Build Entity's scope and shall be furnished and installed by the Owner's structured cabling contractor; final WAP quantity and placement by Owner's wireless network contractor
- Cable management: Organized cable trays (ladder type in mechanical/electrical areas; wire basket tray above ceilings in patient care areas) throughout the building; no cable tray shall pass through electrical rooms or fire-rated barriers without proper fire-stopping

** REQUIRED: JRTC (Junta Reglamentadora de Telecomunicaciones de Puerto Rico) endorsement of the telecommunications point of connection, along with JRTC-endorsed drawings, shall be obtained prior to commencing telecommunications work.*

7.9.2 Nurse Call / Patient Communication System

A fully digital, IP-based nurse call system shall be provided throughout all patient care areas per FGI Guidelines and NFPA 99 requirements for hospital occupancies.

- Patient room stations: One (1) pillow speaker or bedside unit per patient bed with call button, audio communication, and bed/nurse call integration; stations wired to TR per floor
- Corridor dome lights: Visible indicator dome lights (with multiple color zones) above each patient room door and at nursing station corridor display for call annunciation
- Nursing station master stations: Color-touch display panels at each nursing station showing all active calls with priority queuing; audio communication to patient stations
- Staff duty stations: Staff call buttons (duty/code) at nursing stations and support areas

- Emergency/Code stations: Code Blue buttons in ORs, Trauma Stabilization, ICU, and patient rooms; code call shall activate audible annunciation throughout the zone and report to the Disaster Control Center
- Integration: Nurse call system shall integrate with hospital telephone/paging system, and shall have the capability to interface with the BMS for alarm monitoring; interface to real-time location system (RTLS) if provided by Owner
- Essential power: Nurse call system shall be powered from the Essential Electrical System Critical Branch; local UPS backup for head-end controller

7.9.3 Public Address

A fully digital IP-based public address (PA) system rough-in shall be provided throughout the facility per NFPA 72. Design-Build Entity scope is limited to rough-in only (conduit, backboxes, and cable pathways); PA devices and equipment shall be furnished and installed by others, with final device and equipment locations to be coordinated with the Owner's Representative.

- System coverage: All occupied spaces including patient rooms, corridors, ORs, waiting areas, lobbies, stairwells, and exterior areas near building entrances
- Voice intelligibility: System shall be designed for 0.7 STI (Speech Transmission Index) minimum in all occupied areas per NFPA 72; ceiling speaker layout based on room dimensions and background noise levels
- Zones: Minimum one (1) selectable zone per floor plus a building-wide all-call; ORs and ICU on a separate, independently mutable zone for clinical environments; exterior zones for ambulance/heliport areas
- Control: Primary control from the Disaster Control Center (Level 9); secondary control at the main nursing supervisor station; paging microphones at nursing stations per floor
- Essential power: PA system powered from Life Safety Branch; battery backup per NFPA 72 within control equipment for 24-hour standby plus 2-hour voice alarm

7.9.4 Closed-Circuit Television (CCTV) and Access Control

CCTV and Access Control rough-in shall be provided throughout the facility. Design-Build Entity scope is limited to rough-in only (conduit, backboxes, and cable pathways); CCTV and access control devices and equipment shall be furnished and installed by others, with final device and equipment locations to be coordinated with the Owner's Representative.

- CCTV: IP-based digital surveillance system; cameras at all building entrances, exits, stairwells, elevator lobbies, ambulance entrance, heliport access, pharmacy, blood bank, and perimeter areas; indoor dome cameras throughout corridors and key clinical areas as directed by Owner security plan; camera coverage at outdoor substation yard (see Section 4.2.3)
- Recording: Network video recorder (NVR) with minimum 30-day local storage; server located in the Disaster Control Center with failover; cameras backed up to cloud/off-site if Owner elects
- Access Control: Card reader / credential-based access control at all building entrances, clinical zone entries, pharmacy, blood bank, electrical rooms, telecommunications rooms,

stairwell reentry doors, and roof/heliport access; proximity card / mobile credential system; lockdown capability from Disaster Control Center

- Intercom: Video intercom at main public entrances (Emergency Department, main lobby, ambulance entrance) for after-hours access; integrated with access control
- ASEM Integration: CCTV and access control systems shall have the capability to integrate with the existing ASEM Central Services Building security systems; coordinate with ASEM security management
- Essential power: CCTV system NVR, access control head-end, and all door strike/maglocks served from Essential Electrical System (fail-secure configuration per NFPA 101 for stairwell reentry doors; fail-safe where required by life safety code)

7.9.5 Disaster Control and Monitoring Center (Level 9)

The Disaster Control and Monitoring Operations Center on Level 9 is the facility's central operations hub for emergency and disaster response. This room shall be provided with dedicated, redundant power and communications infrastructure to maintain full functionality during emergencies, utility outages, and hurricane events.

- Power: Dedicated Essential Electrical System circuits (Critical Branch) plus a dedicated UPS system (see Section 6.4) for all equipment in the Disaster Control Center; minimum 60-minute UPS runtime at full load
- Data / Network: Dedicated fiber optic connections to the MTR and to the ASEM Central Services Building; redundant network switches with dual power supplies; VoIP telephone system with direct lines to external emergency services
- Communications: Dedicated public address control station, nurse call monitoring display, fire alarm annunciator panel (or remote annunciator), CCTV monitoring workstations, BMS workstation, generator and critical system monitoring displays
- Medical Gas Monitoring: Master alarm panels for all medical gas systems (as required by NFPA 99 — one of the two required master alarm locations shall be the Disaster Control Center); continuous display of all gas/vacuum system statuses
- Satellite / Backup Communications: Provisions (conduit and power stub-outs) for Owner-furnished satellite communication terminal (VSAT) or cellular signal booster for emergency communications independence from local carrier infrastructure
- Room physical security: Access-controlled entry; the room shall be hardened against water intrusion (no overhead piping except fire suppression) and designed for 24/7 occupancy

7.10 FIRE ALARM SYSTEM

A complete, addressable fire alarm and emergency communication system shall be designed and installed in strict compliance with NFPA 72 (National Fire Alarm and Signaling Code) and NFPA 101 (Life Safety Code) throughout the entire facility, including all levels from Basement through Roof Level.

- System Type: Fully addressable, intelligent, multiplex fire alarm system; every initiating device and output device shall have a unique address; the control panel shall provide floor-by-floor and zone-by-zone alarm annunciation
- Control Panel: Listed, addressable fire alarm control panel (FACP) with redundant power supplies (primary AC from Essential Life Safety Branch + 24-hour secondary battery per NFPA 72); located in Security/ Fire Command Center room and a remote annunciators at the Disaster Control Center (Level 9) and Main Lobby.
- Initiating Devices: Addressable manual pull stations at all exit doors and exit stairwell entries per NFPA 72; In addition, manual pull stations to be spaced no further than a travel distance of 200 ft along the route of egress. All inititation devices requires access for inspection, testing and periodic maintenance. Duct detectors must be accessible for inspection testing and maintenance as per NFPA90A.; Addressable smoke detectors (photoelectric) in all corridors, lobbies, common areas, waiting areas, electrical/mechanical rooms, telecommunications rooms, and storage rooms; heat detectors in kitchens, laundry, and spaces inappropriate for smoke detectors; duct smoke detectors on all HVAC supply air ducts ≥ 2,000 CFM per NFPA 90A; waterflow switches and tamper switches from the fire protection system (mechanical) integrated into the fire alarm system per NFPA 72 and NFPA 13

** REQUIRED: Final initiating device locations shall be directed and confirmed in accordance with IBC 2018 , IFC 2018,NFPA 101,NFPA72and NFPA70. The strictest code applies.*

- Notification Appliances: Addressable speaker/strobe combination appliances (ADA-compliant candela ratings) in all corridors, public areas, common areas, and mechanical rooms; visual-only strobes in ORs, ICU rooms, and spaces where audible alarms may be clinically inappropriate (coordinate with Owner)
- Emergency Voice Evacuation: The fire alarm system shall incorporate an emergency voice alarm communication (EVAC) system per NFPA 72; pre-recorded and live voice messages shall override all PA system functions on fire alarm activation; intelligibility per NFPA 72 (0.7 STI minimum)
- Smoke Control Coordination: The fire alarm system shall be the control interface for all HVAC smoke control functions per NFPA 92 — including fan shutdown, fire/smoke damper actuation, and stair pressurization fan start; coordination with the BMS is required (fire alarm controls life-safety smoke control; BMS monitors status)
- Elevator Recall: Fire alarm shall initiate elevator recall to the designated floor per NFPA 72 and ASME A17.1 upon smoke detection at elevator lobbies or machine room
- Door Holder Release: Magnetic door holders (on smoke barrier/corridor doors held open) shall be released by the fire alarm system upon alarm
- Monitoring: The fire alarm system shall be monitored 24/7 by an UL-listed central station per NFPA 72; connection via dedicated telephone line, cellular, and/or IP pathway with primary and secondary paths

- Testing and Inspection: Full system commissioning test at project completion per NFPA 72; annual inspection program established; all test records to be submitted to AHJ and provided to Owner
- High-Rise Provisions: As a ten-story hospital, the building shall comply with all applicable high-rise fire alarm provisions of NFPA 101 and the PRBC, including fire command center provisions and communication with the fire department

7.11 LIGHTNING PROTECTION

A complete lightning protection system (LPS) shall be designed and installed per NFPA 780 (Standard for the Installation of Lightning Protection Systems) and UL 96A (Installation Requirements for Lightning Protection Systems). Puerto Rico's tropical location results in high annual thunderstorm frequency and lightning ground flash density; a properly designed LPS is essential for patient safety and equipment protection.

- Air terminals (rods): UL-listed copper or aluminum air terminals installed at the roof perimeter, at all roof projections, mechanical equipment, and elevated rooftop structures (including cooling towers if above roof level, DOAS units, antennae, and the heliport structure) at spacing per NFPA 780
- Heliport LPS: The heliport structure, FAA obstruction lights, and all conductive equipment on the Roof Level shall be bonded and connected to the LPS; LPS components on the heliport shall comply with FAA Advisory Circular AC 150/5390-2 and shall not obstruct the heliport approach/landing zone
- Conductors: Main size conductors (copper minimum 29 AWG equivalent per NFPA 780 Table 4.7) connecting air terminals to down conductors and to the grounding system; conductors shall be mechanically protected where exposed to damage
- Down conductors: Multiple, symmetrically spaced down conductors along building exterior per NFPA 780; down conductors shall connect to the building ground grid at grade
- Ground termination: LPS down conductors shall terminate at dedicated ground rods at grade, interconnected to the building ground grid; the combined LPS + building ground system resistance shall be measured and documented
- Bonding: All metallic masses on the roof and upper floors (HVAC equipment, piping, ductwork, cable trays, equipment frames) shall be bonded to the LPS to prevent side-flash per NFPA 780 Section 4.14
- Surge Protection Devices (SPDs): In addition to the LPS, coordinated SPDs shall be installed at the main service entrance incoming terminals of the double-ended substation secondary switchgear sections (Type 1), at all distribution panelboards and step-down transformer secondaries (Type 2), and at all sensitive electronic equipment panels (Type 3 where required); SPDs are the secondary line of defense for transient overvoltage protection beyond the primary air termination network
- Testing: Complete LPS test and inspection per NFPA 780 at project completion; visual inspection and continuity test; document to UL 96A Master Label requirements if Owner requires certification

7.12 ENERGY AND SUSTAINABILITY

- Lighting Power Density (LPD): Interior lighting shall comply with ASHRAE 90.1 Table 9.6.1 (Space-by-Space Method) maximum LPD values for all space types; LED luminaires with high efficacy (minimum 100 lm/W for general spaces) shall be specified
- Automatic Lighting Controls: Automatic shutoff per ASHRAE 90.1 Section 9.4.1 in all applicable spaces; occupancy/vacancy sensors in private offices, conference rooms, and support spaces; daylight harvesting in perimeter zones with adequate glazing; scheduling controls for exterior and non-24-hour spaces
- Power Factor Correction: The electrical distribution design shall include power factor correction (capacitor banks distributed at motor loads) to maintain a minimum facility power factor of 0.90 lagging at the utility meter
- Energy Metering: Multi-function metering at the double-ended substation secondary switchgear sections (Section 5.1); all metering data integrated into BMS for real-time monitoring and energy reporting
- Generator Fuel Efficiency: Emergency generators sized to operate efficiently at typical EES load (50–80% of rated kW); avoid gross oversizing that degrades part-load fuel efficiency; generator fuel consumption at rated and test loads shall be documented

7.13 INTERFACE WITH EXISTING ASEM CENTRAL SERVICES BUILDING

The proposed Trauma Hospital will be structurally and functionally integrated with the existing ASEM Central Services Building at three (3) levels. The Design-Build Entity shall coordinate all electrical interfaces and interconnections with ASEM facilities management and shall ensure no interruption to active electrical services in the existing hospital during construction.

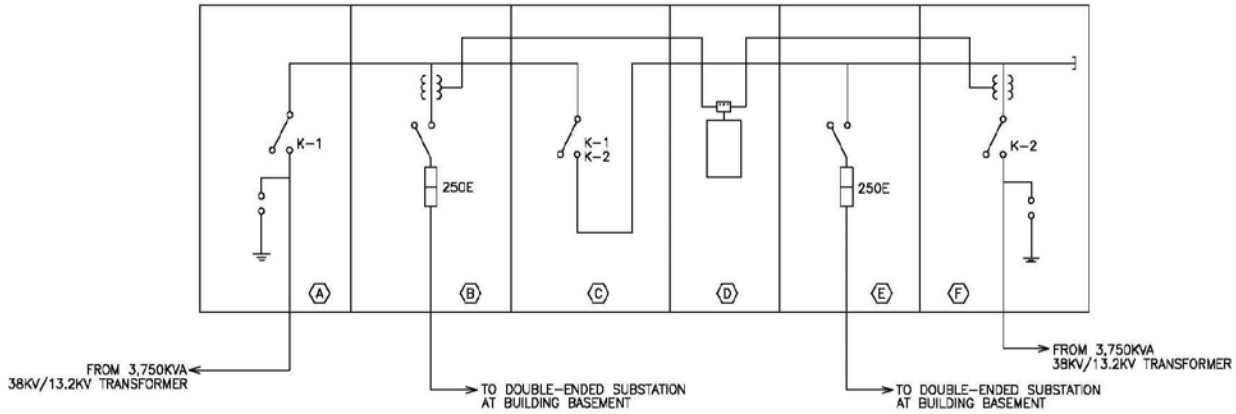
- Corridor Connector (Level 2): The corridor connector to the ASEM Central Services Building second level shall be provided with all required electrical services including: lighting (normal and emergency), fire alarm devices, access control door hardware, and data/communications outlets; the connector shall be treated as a separate fire alarm zone with its own initiating devices
- Fire Alarm Integration: The new Trauma Hospital fire alarm system shall be coordinated with the existing ASEM building fire alarm system

7.14 DESIGN-BUILD ENTITY SCOPE AND KEY DESIGN CONSTRAINTS

7.14.1 Items Fully in Design-Build Entity Scope

- Electrical design by a Professional Engineer (PE) licensed in Puerto Rico and an active member of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR); all drawings and design documents signed and sealed by the Puerto Rico-licensed PE

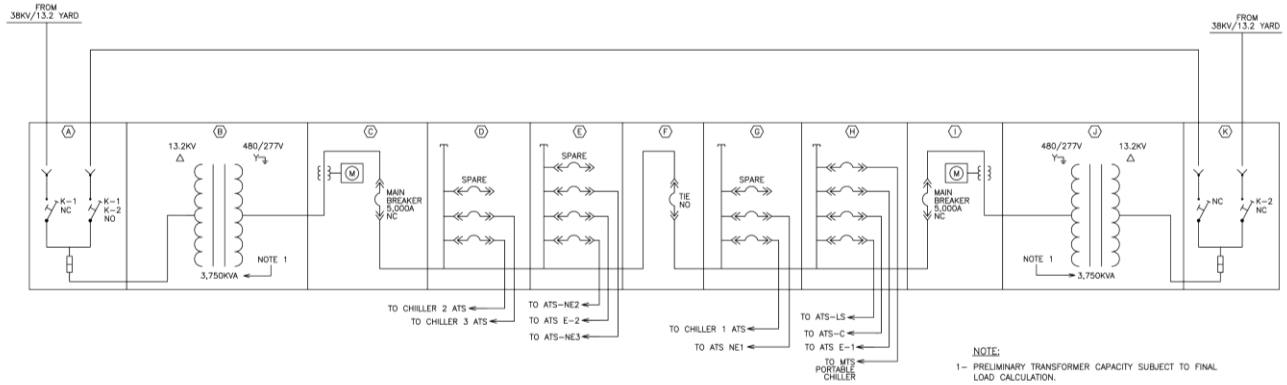
- All utility coordination with LUMA — interconnection application, load study, metering — through LUMA approval and energization
- Complete outdoor yard-type substation (civil, structural, electrical — two less-flammable liquid-filled, copper-wound 3,750 kVA transformers (38 kV delta primary / 13.2 kV wye secondary) on 4-inch concrete pads with oil containment, 38 kV aluminum primary structure, 15 kV primary switchgear with tie switch, protection, metering) from the LUMA aerial point of connection through two 13.2 kV feeders (separate manholes) to the indoor Building Basement double-ended substation (duplex load-break switch and fuse assemblies, two dry-type, copper-wound VPI/VPE 3,750 kVA transformers, and the double-ended substation secondary switchgear sections with two main breakers, four distribution sections, and a tie breaker)
- All electrical systems described in this Bridging Document from utility service entrance through final connections at each device, receptacle, lighting fixture, and equipment terminal
- All permits, inspections, and regulatory approvals for electrical systems (LUMA, PRBC, PRDOH, AHJ)
- Arc flash analysis and installation of arc flash hazard labels on all switchgear and panelboards per NFPA 70E
- Training of Owner's facilities staff on all electrical systems (minimum 8 hours per system for major systems — generators, switchgear, fire alarm, lighting controls, UPS)
- Short-circuit and protective device coordination study, including calibration and field setting of all protective devices



7.14.2 Key Design Constraints

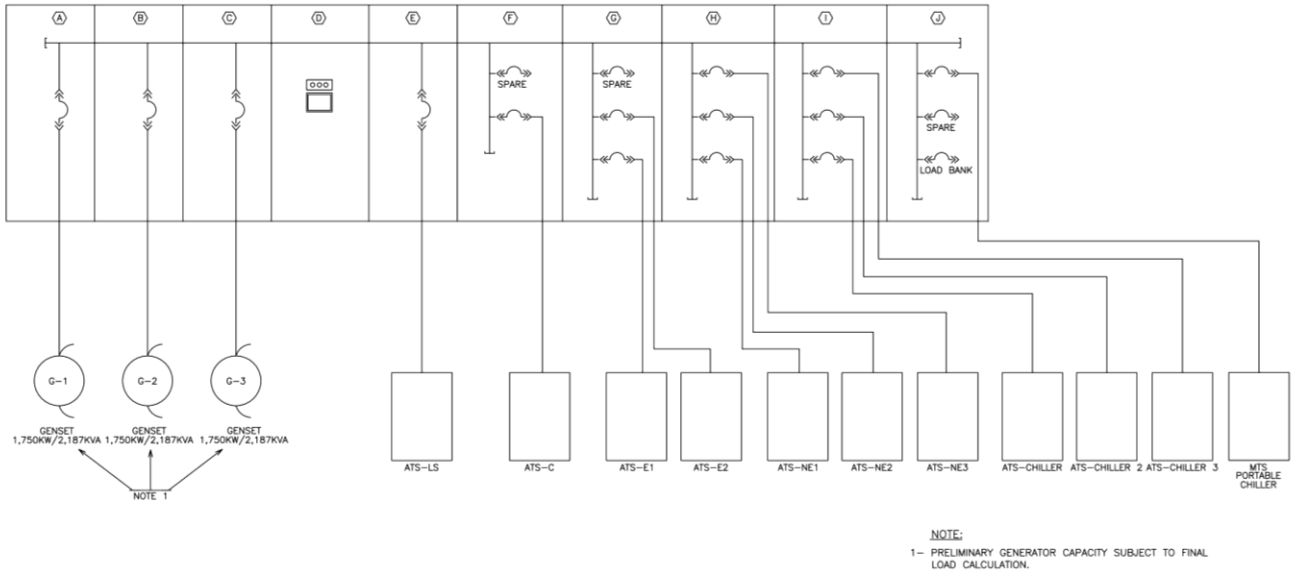
- Seismic isolation plane at the Interstitial Level: All electrical conduits, cable trays, and equipment crossing the seismic isolation plane must use flexible connections / seismic loops to accommodate differential movement; electrical system design shall account for the building's seismic isolation system
- The Heliport (Roof Level) creates restricted airspace — all rooftop electrical equipment (antenna masts, HVAC equipment, generators exhaust stacks, photovoltaic if added) must comply with FAA heliport obstruction clearance requirements per AC 150/5390-2
- Tropical and hurricane environment: All outdoor and exposed electrical equipment (substation, generators, site lighting, exterior conduit and junction boxes) shall be rated for 180 mph design wind speed per ASCE 7 and PRBC; all exterior enclosures shall be NEMA 3R (stainless steel or fiberglass) for corrosion resistance in Puerto Rico's coastal/marine climate
- LUMA coordination timeline: 38 kV interconnection approval from LUMA can require significant lead time; Design-Build Entity shall initiate LUMA interconnection process immediately upon contract award and shall not allow LUMA approval to be the critical path
- Surge Capacity in Private Rooms: The Design-Build Entity shall provide electrical, nurse call, and telecommunications provisions for two (2) beds per room in 72 private rooms, to accommodate surge capacity

7.15 ELECTRICAL DESIGN NARRATIVE ANNEXES



The following annex drawings are included for reference, illustrating the single-line configuration of key electrical distribution equipment described in this Bridging Document:

7.15.1 Annex 1 - Primary 15 kV Switchgear at Substation Yard



ANNEX 1: 15KV PRIMARY SWITCHGEAR AT 38KV YARD
SCALE= N.T.S.

7.15.2 Annex 2 – Double-Ended Substation

ANNEX 2: DOUBLE-ENDED SUBSTATION
SCALE= N.T.S.

7.15.3 Annex 3 – Paralleling Switchgear

ANNEX 3: PARALLELING SWITCHGEAR
SCALE= N.T.S.

8.0 MECHANICAL DESIGN NARRATIVE

MECHANICAL SYSTEMS

Air Conditioning • Plumbing • Fire Protection • Medical Gases

8.1 INTRODUCTION AND PURPOSE

This Bridge Document establishes the Mechanical Engineering performance requirements, design criteria, and minimum system standards that the Design-Build (D&B) Contractor must incorporate into the design and construction of the Puerto Rico Trauma Hospital located at Centro Médico, San Juan, Puerto Rico.

This document bridges the Owner's programmatic requirements — as established in the Architectural Project Design Summary and Construction Project Description — with the Design-Build Entity's design responsibility. The Contractor shall use this document, together with all referenced codes and standards, as the Basis of Design (BOD) for the following mechanical systems:

- Air Conditioning and Ventilation (HVAC)
- Plumbing — Potable Water, Hot Water, and Drainage
- Fire Protection — Sprinkler and Standpipe Systems
- Medical Gases — Supply, Distribution, and Alarm Systems

The Design-Build Entity shall engage licensed Professional Engineers (PE) for all mechanical systems. The Engineer of Record responsible for the mechanical design and the design drawings shall be a Professional Engineer licensed to practice in the Commonwealth of Puerto Rico and an active member in good standing of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR). All design documents and drawings shall be signed and sealed by the Puerto Rico-licensed PE. The Design-Build Entity shall submit design documents for Owner review at Schematic Design (SD), Design Development (DD), and Construction Documents (CD) phases.

8.2 PROJECT OVERVIEW

8.2.1 Facility Description

The Puerto Rico Trauma Hospital is a new 215,880 square foot, ten-story acute care trauma facility to be constructed on the campus of the Puerto Rico Medical Center (Centro Médico) in San Juan, Puerto Rico. The facility will be structurally integrated with the existing ASEM Central Services Building at three levels.

8.2.2 Critical Clinical Areas Driving Mechanical Design

- 5 Trauma Operating Rooms (Ground Level) — OR-A/B/C/D at 600 SF each, OR-E at 400 SF; Class B positive pressure, independent dedicated air systems, 20 ACH per ASHRAE 170
- Trauma Stabilization — 16 treatment cubicles + 1 airborne infection isolation (AII) room.

- Trauma ICU — 28 private rooms + 4 isolation rooms (Levels 1 & 2)
- Trauma Telemetry, Intermediate Care, and Physical Rehab nursing floors (Levels 4–7)
- Imaging Department: CT Scanner and X-Ray (Ground Level)
- Minor Procedure Rooms (Levels 2, 4, 5, 6, 7)
- Heliport with dedicated elevator core (Roof Level)
- Disaster Control and Monitoring Operations Center (Level 9)

8.2.3 Surge Design Basis — All Mechanical Systems

The facility is designed for a normal occupancy of 110 beds and a surge capacity of 182 beds, achieved by placing two (2) patients per patient room. ALL mechanical systems shall be designed and sized for the SURGE CAPACITY of 182 beds (two beds per room), not the normal occupancy of 110 beds. This is the governing design basis for equipment sizing, flow calculations, and system capacity across all disciplines.

- HVAC: Computerized cooling load analysis shall be based on surge occupancy (2 patients + visitors + staff + double medical equipment loads per room). FCU minimum capacity 24,000 BTU/hr per room sized for surge. AHU and chiller plant capacity verified against surge peak load.
- Medical Gases: All patient room outlets provided as double stations (2 per gas per room) per surge occupancy. Medical air compressor (triplex) and vacuum (quadruplex) system capacities shall be verified against simultaneous surge demand, including potential for multiple patients on mechanical ventilation.
- Plumbing: Domestic water demand calculations (fixture units, pipe sizing, booster pump capacity) shall be based on surge occupancy (182 beds). Fire protection design occupancy per NFPA 101 shall reflect surge bed count.
- The Design-Build Entity shall clearly document the surge occupancy basis in the Mechanical Basis of Design (BOD) narrative and in the computerized cooling load analysis, and shall confirm that all specified equipment meets surge capacity requirements before final equipment selection.

8.3 APPLICABLE CODES AND STANDARDS

The Design-Build Entity's design shall comply as a minimum with the following codes, standards, and guidelines. Where conflicts exist, the most stringent requirement shall govern. The Contractor is responsible for determining any additional codes adopted locally in Puerto Rico at the time of permit application.

8.3.1 Federal and Local Codes

- Puerto Rico Building Code (PRBC) — latest adopted edition
- Puerto Rico Department of Health (PRDOH) — Hospital Licensure Regulations
- Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR) — professional licensing; mechanical design signed and sealed by a Puerto Rico-licensed PE who is a CIAPR member

- Americans with Disabilities Act (ADA) — 2010 ADA Standards for Accessible Design
- Occupational Safety and Health Administration (OSHA) requirements.
- Puerto Rico Joint Permits Regulation (Reglamento Conjunto 2023).

8.3.2 NFPA Standards

- NFPA 99 — Health Care Facilities Code (latest edition) — Medical Gas Systems, Category 1
- NFPA 13 — Standard for the Installation of Sprinkler Systems
- NFPA 14 — Standard for the Installation of Standpipe and Hose Systems
- NFPA 20 — Standard for the Installation of Stationary Pumps for Fire Protection
- NFPA 24 — Standard for the Installation of Private Fire Service Mains
- NFPA 72 — National Fire Alarm and Signaling Code (coordination with fire alarm)
- NFPA 101 — Life Safety Code
- NFPA 99 Chapter 14 — Hyperbaric Facilities
- NFPA 30 — Flammable and Combustible Liquids Code (diesel fuel storage)
- NFPA 110 — Standard for Emergency and Standby Power Systems (generator fuel coordination)
- NFPA 54 / NFPA 58 — National Fuel Gas Code / LP-Gas Code (LPG hot water and storage)

8.3.3 ASHRAE Standards

- ASHRAE 55 — Thermal Environmental Conditions for Human Occupancy
- ASHRAE 62.1 — Ventilation for Acceptable Indoor Air Quality
- ASHRAE 90.1 — Energy Standard for Buildings (minimum energy efficiency)
- ASHRAE 170 — Ventilation of Health Care Facilities — PRIMARY HVAC DESIGN STANDARD
- ASHRAE 64 — Methods of Testing Remote Mechanical-Draft Evaporative Refrigerant Condensers

8.3.4 Healthcare Facility Guidelines

- Facility Guidelines Institute (FGI) Guidelines for Design and Construction of Hospitals — latest edition
- Joint Commission Environment of Care standards (if applicable to accreditation)
- SMACNA — HVAC Duct Construction Standards — Metal and Flexible
- ASSE 1010, 1017, 1070 — plumbing device standards
- ASHE — American Society for Healthcare Engineering guidelines

8.3.5 Sustainability

- U.S. Green Building Council LEED — LEED certification is optional at the Design-Build Entity's discretion (not mandatory); if pursued, the NC rating system applies. Sustainable/energy-efficient design practices are encouraged regardless of certification

8.4 AIR CONDITIONING AND VENTILATION (HVAC)

The HVAC system shall ensure patient safety, infection control, thermal comfort, and energy efficiency consistent with the requirements of ASHRAE 170 and FGI Guidelines. The Design-

Build Entity shall prepare a full HVAC Basis of Design narrative and room-by-room air balance schedule for Owner review.

8.4.1 Design Conditions

Parameter	Outdoor (San Juan, PR)	Indoor Design
Summer Dry Bulb (DB)	91°F DB / 79°F WB	—
Humidity (Outdoor)	~80% RH (tropical)	—
Patient Rooms (ICU/Med-Surg)	—	70–75°F / 30–60% RH
Operating Rooms	—	68–75°F / 20–60% RH (ASHRAE 170)
Administrative / Offices	—	72°F ±2°F
Emergency / Trauma Stabilization	—	70–75°F / 30–60% RH

8.4.2 Chilled Water Plant

The primary cooling plant shall be located in the Basement level mechanical plant area. The plant shall be based on three (3) chiller units, each rated a minimum of 800 tons of refrigeration, operating two (2) units with one (1) unit as backup (2+1 / N+1 redundancy). This provides a firm plant capacity of 1,600 tons with full redundancy.

Pumping Configuration: The chilled water system shall be a variable primary flow (primary-only) type. A single set of variable-speed primary chilled water pumps shall circulate water through the chillers and the distribution loop; chilled water flow through the system shall be modulated by the two-way energy valves at each coil, with pump speed controlled to maintain system differential pressure. A minimum-flow bypass with a control valve shall be provided to protect the chillers from low-flow conditions during periods of low demand.

- Chiller Type: Centrifugal type, water-cooled, with cooling tower as condenser medium
- Minimum Unit Efficiency: 0.58 kW/ton or better, in compliance with ASHRAE 90.1 and ASHRAE 64
- Quantity and Capacity: Three (3) chiller units, each minimum 800 tons refrigeration; two (2) units operating (duty) and one (1) unit standby (backup). Firm/operating capacity = 1,600 tons. The Design-Build Entity shall verify the 800-ton minimum unit size against a computerized building load computation (see Section 10.3) and increase capacity if required, while maintaining the three-unit 2+1 arrangement
- Leaving Chilled Water Temperature: 38°F leaving chilled water temperature; the lower supply temperature shall be coordinated with coil selection and dehumidification requirements for Puerto Rico's tropical climate
- Cooling Tower: Induced-draft type; located in the dedicated Mechanical Roof Yard at the Second Level (per the schematic plans), not on the main roof. The condenser water plant shall consist of six (6) cooling tower cells — four (4) operating (duty) and two (2) backup — matching the three-chiller (2+1) plant and preserving N+1 redundancy on the condenser

side. This quantity is consistent with the schematic plans; the Design-Build Entity shall confirm final cell sizing against the chiller condenser load

- Cooling Tower — Construction: Full stainless steel construction (basin, casing, and structural components) for corrosion resistance in Puerto Rico's coastal/marine environment and to maximize service life; stainless steel hardware and fasteners throughout
- Cooling Tower — Seismic Protection: The cooling tower(s) shall be provided with seismic restraints, anchorage, and isolation/snubber assemblies designed for the project seismic loads; equipment, supports, and connections shall be coordinated with the building's seismic isolation system, and all piping crossing the seismic isolation plane shall use flexible seismic connectors (see Section 11.3)
- Cooling Tower Fans — Noise Attenuation: Cooling tower fans shall be provided with noise attenuation (low-noise fan blades and/or fan discharge/intake sound attenuators) to meet site noise criteria, given the proximity to occupied patient floors, the heliport, and adjacent hospital buildings on the Centro Médico campus; the Design-Build Entity shall confirm sound power/pressure limits and provide acoustical calculations
- Cooling Tower Fans — VFD: Cooling tower fans shall be driven by variable frequency drives (VFDs) to modulate fan speed for condenser water temperature control, energy savings, and further noise reduction at part-load operation
- Condenser Water Temperatures: Condenser water entering the chiller at 85°F and leaving the chiller at 97°F (12°F condenser range) at design conditions. Note: the cooling tower cools the water leaving the chiller (97°F) back down to 85°F before it re-enters the chiller; tower selection shall achieve the 85°F entering-condenser-water temperature at the San Juan design wet-bulb
- Condenser Water Flow: 2.3 GPM per ton of refrigeration through the chiller condenser; condenser water pumps and piping shall be sized for this flow at each chiller (e.g., ≈ 1,840 GPM per 800-ton chiller). Condenser water pumps shall be arranged one per chiller to match the 2+1 plant, with VFDs
- Chilled Water Supply/Return Temperatures: 38°F supply / 53°F return (15°F ΔT); the system shall be designed around a 15°F chilled water temperature difference to maximize plant efficiency and minimize pumping energy

8.4.2.1 Chiller Room — Acoustic and Vibration Isolation

The Main Chiller Room is located in the Basement level directly below the Trauma Surgery Department and Operating Rooms on the Ground Level. Because centrifugal chiller compressors generate significant noise and vibration, the chiller room shall be designed and constructed as a sound-isolated mechanical room to prevent transmission of noise and vibration to the surgical suites above. The following measures are required:

- Enclosure: Chiller room walls, floor slab, and ceiling (underside of Ground Level slab) shall be constructed with sound-rated assemblies, minimum STC 60, or as determined by the acoustic consultant, including mass-loaded assemblies, resilient layers, and/or floating floor construction

- Equipment Vibration Isolators: All chillers, pumps, cooling tower fans, and rotating equipment shall be mounted on inertia-base vibration isolators (spring-type or combination spring-neoprene) sized for each piece of equipment to attenuate vibration transmission to the building structure
- Flexible Pipe Connectors: All chilled water and condenser water piping connections at equipment shall use flexible vibration-isolation pipe connectors to prevent structure-borne noise transmission through the piping system
- Acoustic Doors: Chiller room access doors shall be acoustically rated (STC 50 minimum), gasketed, and self-closing
- Duct Silencers: Mechanical ventilation ducts penetrating the chiller room walls or slab shall include duct silencers/sound attenuators to prevent flanking noise transmission
- Acoustic Consultant: The Design-Build Entity shall engage a qualified acoustic consultant to perform a noise and vibration analysis and confirm compliance with the maximum noise criteria (NC) levels for operating rooms (NC-20 to NC-25 per FGI/ASHRAE 170 guidelines) at the Ground Level above; the acoustic report shall be submitted to the Owner at Design Development phase

8.4.3 Chilled Water Distribution

- Vertical Distribution — Dual Risers: Because each patient care floor is served by two (2) AHUs, chilled water shall be distributed vertically through two (2) independent risers. Each riser shall feed one of the two AHUs on each floor, so that the loss or isolation of one riser leaves the other AHU — and therefore partial cooling capacity — in service on every floor
- Each riser shall be independently valved and isolatable at each floor takeoff and at the plant, allowing maintenance of one riser without shutting down the entire building
- Risers shall be sized so that, where feasible, one riser can carry a partial load for life-safety and critical areas during maintenance of the other; the Design-Build Entity shall evaluate cross-connection with isolation valves at the plant header to allow either set of primary pumps to feed either riser
- Piping: Seamless cast iron Schedule 40 for pipe diameters above 2½"; Copper Type K for 2" diameter and smaller
- Insulation: All chilled water and reheat water piping shall be insulated per the Pipe Insulation Schedule below. Vapor barrier is required on all chilled water piping to prevent condensation in Puerto Rico's tropical humid climate. All insulation materials shall comply with FSI <=25 / SDI <=50 per ASTM E84 and NFPA 90B.

Pipe Insulation Schedule

Service / Temp.	Min. Dia. (in)	Max. Dia. (in)	Min. Thickness	K Value / Calc. R	Material Type	Outdoor Finish	Indoor Concealed Finish	Indoor Exposed Finish
CHILLED WATER 40 - 60°F	1/2"	1"	1-1/2"	K=0.19 @ 50F R-7.9	Poly-Isocyanurate (PIR) with Integral Vapor Retarder (Perm <=0.05). FSI <=25 / SDI <=50. ASTM E84, NFPA 90B	Continuous Vapor Retarder Jacket (Perm <=0.05) + 6 oz. Canvas with MON ECO 55-10 & 55-50 Mastic + 0.016" Alum. Alloy Jacket with Sealed Laps	Continuous Vapor Retarder Jacket (Perm <=0.05) + MON ECO 55-50 Mastic with White Finish	Continuous Vapor Retarder Jacket (Perm <=0.05) + MON ECO 55-50 Mastic + Manville Zeston PVC Jacket 30 MLS White Gloss. Flame Spread <=25 / Smoke Dev. <=50, ASTM E84
	1-1/4"	2"	1-1/2"	K=0.19 @ 50F R-7.9				
	2-1/2"	8"	2"	**K=0.19 @ 50F R-10.5**				
REHEAT WATER 95 - 120°F	1/2"	1"	1"	K=0.26* @ 107F R-3.8	Rigid Fiberglass Micro-Lok(R) by Johns Manville. FSI <=25 / SDI <=50. ASTM E84, NFPA 90B	6 oz. Canvas with MON ECO 55-10 & 55-50 Mastic + 0.016" Alum. Alloy Jacket with Vapor Barrier Foil and Sealed Laps	MON ECO 55-50 Mastic with White Finish and Vapor Barrier Foil	MON ECO 55-50 Mastic + Manville Zeston PVC Jacket 30 MLS White Gloss. Flame Spread <=25 / Smoke Dev. <=50, ASTM E84
	1-1/4"	2"	1-1/2"	K=0.26* @ 107F R-5.8				
	2-1/2"	8"	2"	K=0.26* @ 107F R-7.7				

- * K value for Rigid Fiberglass at 107F mean temperature per manufacturer data
- Pipe supports, hangers, and expansion compensation per ASHRAE and SMACNA standards
- Isolation valves, balancing valves, and pressure/temperature test ports at all major branches and at each riser takeoff

8.4.4 Chilled Water Pumps

- Type: Vertical inline centrifugal pumps; arranged as variable primary flow (primary-only) pumps serving both the chillers and the distribution loop. Vertical inline configuration saves floor space in the chiller room and eliminates the need for a separate base plate and coupling guard
- Motors: Totally enclosed fan-cooled (TEFC), minimum 15 HP each
- Configuration: One (1) variable primary pump per chiller — three (3) pumps total, matching the three-unit 2+1 chiller arrangement (two duty, one standby); pumps staged and interlocked with their associated chillers
- Variable Frequency Drives (VFDs) on all chilled water pumps; pump speed modulated to maintain system differential pressure as two-way energy valves throttle flow
- Chilled Water Bypass (REQUIRED): A chilled water bypass line with a modulating control valve is required and shall be provided across the supply and return mains at the plant. The bypass shall maintain each chiller's minimum evaporator flow at all times under low-load conditions when the two-way energy valves throttle distribution flow — preventing chiller low-flow trips, protecting against evaporator freeze at the 38°F supply temperature, and ensuring stable variable primary flow operation
- The bypass control valve shall be controlled by the central automatic control system, modulated based on measured primary loop flow versus the active chillers' minimum flow setpoint; the bypass shall fail open on loss of control signal or power
- Flow metering on the primary loop integrated into the central control system for chiller staging and ΔT verification

- Automatic lead-lag switching and standby pump auto-start on duty pump failure

8.4.5 Air Handling Units (AHUs) and Fan Coil Units

8.4.5.1 System Architecture

- Patient Care Floors (Levels 2, 4, 5, 6, 7): Provide a minimum of two (2) air conditioning units (AHUs) per floor serving the patient room floor common areas (corridors, nursing stations, support spaces, waiting/visitor areas). The two units per floor provide redundancy so that the loss of one unit does not leave the floor without conditioned air. Each of the two AHUs shall be fed from a separate independent chilled water riser (see Section 4.3) for full hydraulic redundancy
- Patient Rooms: Provide one (1) dedicated fan coil unit (FCU) per patient room, minimum 24,000 BTU/hr capacity, to serve the surge configuration of two (2) beds per room. Each FCU is independently controlled per room without affecting adjacent rooms
- Operating Rooms, ICU, Isolation, and Procedure Rooms: Served by independent, dedicated AHU systems (not by the patient-room FCU arrangement) due to higher air change rates, HEPA filtration, and pressure relationship requirements per ASHRAE 170
- Surgical AHU — UV Light (REQUIRED): The AHUs serving the Surgery Department / Operating Rooms shall be provided with ultraviolet germicidal irradiation (UV-C / UVGI). UV-C lamps shall be installed downstream of the cooling coil and over the drain pan to keep coil and pan surfaces free of microbial growth and to provide air disinfection. Lamps shall be accessible for safe maintenance with interlocked access doors and run-time monitoring integrated into the central control system

8.4.5.2 Air Handling Units (AHUs)

- Location: Rooftop or dedicated mechanical rooms as determined by Design-Build Entity
- Type: Modular, draw-through, exterior-rated (roof units), double-wall casing construction (insulation fully encapsulated between an inner and outer metal liner) for cleanability, infection control, and condensation prevention in the tropical climate; with: modular filters (MERV-14 minimum for clinical areas; HEPA for OR and isolation rooms), chilled water cooling coil, reheat coil (electric or hot water, for dehumidification reheat only — not space heating, which is not required in Puerto Rico's tropical climate), supply/return fans with VFDs, two-way energy valve on chilled water coil, stainless steel drain pan with trap
- AHU Condensate Drain: All AHU condensate drain pans shall be stainless steel, double-sloped, with deep-seal traps; the condensate drain piping shall be insulated with vapor barrier to prevent condensation/sweating on the pipe exterior in the humid climate
- Chilled Water Coil ΔT: All AHU chilled water coils shall be selected for a minimum 15°F water temperature difference (38°F entering / 53°F leaving) at design conditions; coil rows, fin spacing, and circuiting shall be selected to achieve and maintain the 15°F ΔT, enforced by the two-way energy valves
- Constant Flow Operation: AHUs shall be constant air volume (CV) — fans deliver a fixed design airflow. The return (and supply) air temperature shall be regulated by the two-way energy valve modulating chilled water flow through the coil, rather than by varying airflow. VFDs on fans are used for balancing, filter-loading compensation, and night/standby

setback — not for load-based flow modulation. This constant-flow strategy maximizes coil dehumidification for the tropical climate

- Quantity: Minimum two (2) AHU units per patient care floor for common areas, plus dedicated AHUs for OR, ICU, and critical care areas; Design-Build Entity to determine total quantity based on system design and zoning
- Airflow: Minimum average 15,000 CFM per handler; confirm based on ASHRAE 170 room-by-room calculations
- Zoning: Common area AHUs are constant air volume (CV); zone temperature regulated by the two-way energy valve modulating chilled water flow at the coil. All critical care areas on independent, dedicated air systems
- Outdoor Air: AHUs and fan coil units shall receive pre-conditioned ventilation air from the Dedicated Outdoor Air System (DOAS) — see Section 4.6. AHUs and fan coils handle space sensible cooling load and recirculation; the DOAS handles the outdoor air ventilation and latent (dehumidification) load
- All Air Handling Units (AHU) serving ground level areas, specifically operating room areas and related support services, stabilization/observation areas and related support services, and critical care unit areas related support services shall have additional direct expansion refrigerating fan coil capacity as backup during any chilled water system operative failure.

8.4.5.3 Fan Coil Units (FCUs)

- Application: One (1) FCU per patient room, minimum 24,000 BTU/hr capacity (sized for surge occupancy of two beds per room), and at perimeter zones, offices, and support spaces where applicable for individual space control
- Type: Chilled water fan coil units with double-wall casing construction, with VFD or ECM (electronically commutated) fan motors; concealed ceiling or vertical type as suited to room layout
- Coil: Chilled water cooling coil served by the central plant, controlled by a two-way energy valve; individual room thermostat control via BMS-integrated DDC controller reporting to the central computer system
- Outdoor Air: All FCU ventilation air shall be supplied pre-conditioned from the DOAS — no direct outdoor air intake at individual FCUs; this ensures positive pressure and proper humidity control in each patient room
- Condensate: Each FCU drain pan piped to drainage with trap; the condensate drain line shall be insulated with vapor barrier to prevent condensation on the pipe exterior in the humid climate; condensate monitoring/overflow protection to prevent water damage above occupied patient rooms
- Filtration: Minimum MERV-8 at FCU (return) in addition to MERV-14 ventilation air from DOAS; serviceable filter access required

8.4.6 Dedicated Outdoor Air System (DOAS)

All outdoor (ventilation) air serving the Air Handling Units and Fan Coil Units shall be supplied through Dedicated Outdoor Air System (DOAS) units. The DOAS decouples ventilation and dehumidification from space sensible cooling, which is critical in Puerto Rico's hot and humid

tropical climate to maintain the relative humidity limits required by ASHRAE 170 and FGI for healthcare spaces.

- Location: The DOAS units shall be located in the upper Mechanical Room at the Ninth Level, directly beneath the Roof-Level Heliport (per the schematic plans). Outdoor air intakes shall be positioned to draw clean air away from the heliport exhaust/downwash, generator and cooling tower discharges, and any vent terminals; the Design-Build Entity shall verify intake separation distances per ASHRAE 170 / FGI and FAA heliport clearance requirements
- Configuration: Dedicated outdoor air units that filter, cool, dehumidify, and (as required) reheat 100% outdoor air to a neutral or cold supply air condition before delivery to AHUs, FCUs, or directly to spaces
- Dehumidification: DOAS shall deliver supply air at a low dew point (target 50–55°F leaving air dew point) to satisfy the entire latent load of the building and maintain space RH within ASHRAE 170 limits (30–60% RH for clinical areas)
- Energy Recovery: Each DOAS unit shall include total energy recovery (enthalpy wheel or membrane energy exchanger, minimum 60% effectiveness) between outdoor air intake and building exhaust air; cross-contamination must comply with ASHRAE 170 — no energy recovery between exhaust from isolation/contaminated areas and supply air
- Patient Room Bathroom Exhaust: The patient room bathroom (toilet) exhaust shall be ducted to and integrated with the DOAS as the exhaust air source for energy recovery. Because the conditioned bathroom exhaust is cooler and drier than outdoor air, routing it through the DOAS energy recovery device pre-cools and pre-dehumidifies the incoming outdoor air, reducing the cooling/latent load on the DOAS coil
- The bathroom exhaust energy recovery device shall be a sensible/total recovery type with no cross-contamination of airstreams (membrane plate exchanger or run-around coil preferred over wheel for toilet exhaust to avoid odor/contaminant transfer); bathroom exhaust shall be maintained at negative pressure relative to the patient room at all times
- Bathroom exhaust fans shall run continuously (or be interlocked with the DOAS) to maintain the required exhaust air flow for energy recovery and to keep the toilet room under negative pressure per ASHRAE 170
- Filtration: Minimum MERV-14 at DOAS; additional final filtration at downstream AHUs serving critical areas
- Cooling: Chilled water coil served by the 38°F leaving chilled water from the central plant to achieve required low dew point
- Reheat: Hot water, electric, or recovered-heat reheat to deliver neutral supply air where required to avoid overcooling spaces
- Redundancy: N+1 configuration for DOAS units serving critical care areas; Design-Build Entity to determine final quantity and capacity based on total building ventilation requirements per ASHRAE 170
- Controls: Each DOAS integrated into the BMS with leaving air temperature, dew point, and airflow monitoring; demand-controlled ventilation via CO_2 sensors where permitted by ASHRAE 170

8.4.7 ASHRAE 170 — Critical Space Ventilation Requirements

The following minimum requirements per ASHRAE 170 (Table 7.1) shall be incorporated. The Design-Build Entity shall provide a complete room-by-room schedule as part of the Basis of Design.

Space Type	Min. ACH Total	Min. ACH OA	Pressure Rel.	HEPA / Filtration
Trauma Operating Rooms	20	4	Positive (+)	HEPA at supply
Pre/Post-Op Nursing	6	2	Positive (+)	MERV-14
Trauma ICU — Pvt Rooms	6	2	Positive (+)	MERV-14
Airborne Infection Isolation (AII)	12	2	Negative (−)	HEPA at exhaust
Trauma Stabilization Cubicles	6	2	Neutral/Positive	MERV-14
Minor Procedure Rooms	6	2	Positive (+)	MERV-14
Imaging — CT / X-Ray	6	2	Neutral	MERV-14
Soiled Utility / Janitor	10	10	Negative (−)	None required
Med-Surg Patient Rooms	6	2	Positive (+)	MERV-14
Corridors — Clinical	2	—	Neutral	MERV-13

8.4.8 Ductwork

- Material: Galvanized steel, per SMACNA HVAC Duct Construction Standards, minimum 26-gauge for low pressure systems
- Velocity: Maximum 1,500 FPM in main ducts; 1,000 FPM in branch ducts serving clinical spaces
- Static Pressure Drop: Supply and return ductwork shall be designed for a maximum friction loss of 0.08" WG (water gauge) per 100 LF of duct. Exhaust ductwork shall be designed for a maximum friction loss of 0.015" WG per 100 LF of duct. All ductwork shall be sized accordingly to maintain these design criteria
- Insulation: All supply, return, and exhaust ducts (except terminal general-exhaust ducts discharged directly to atmosphere) shall be insulated per the Ductwork Insulation Schedule below. Patient room bathroom exhaust ducting routed to the DOAS for energy recovery shall be insulated to preserve the recoverable energy.

Ductwork Insulation Schedule

Location	Insulation to Duct	K Value	R Value	Density	Thickness	Material Type	NFPA Grade
Interior Concealed	Supply / Return / Exhaust	0.25 BTU-IN/HR at 75°F	R-6	1.5 LB/FT³	1½"	Flexible Fiberglass with FSK Vapor Barrier	—
Interior Exposed	Supply / Return / Exhaust	0.25 BTU-IN/HR at 75°F	R-8	1.5 LB/FT³	2"	Rigid Fiberglass with FSK Vapor Barrier	Flame Spread C25 / Smoke C50 per ASTM E84
Exterior	Supply	0.25 BTU-IN/HR at 75°F	R-10	6 LB/FT³	2"	Rigid Polyisocyanurate with Canvas and Mastic, Painted White with Aluminum (0.16) Cover	—

- All supply air ducts serving ORs and isolation rooms shall have no flex duct beyond final 12"
- Duct leakage class per SMACNA; all systems serving critical care areas to be pressure tested prior to ceiling close-out
- Fire/Smoke Dampers (REQUIRED): The outdoor air and exhaust air ducts that run through the vertical chases/shafts from the First through the Tenth Levels shall be provided with combination fire/smoke dampers (FSD) at every point where the ducts penetrate a fire-rated floor or shaft enclosure, per NFPA 90A, NFPA 101, and the building code. Each FSD shall be UL 555/555S listed with the fire rating matching the rated barrier penetrated
- FSD Actuation and Monitoring: Fire/smoke dampers shall close automatically on signal from the fire alarm system (smoke detection) and on loss of power, using electric actuators with end-switch position indication reported to the fire alarm system and the central control system (BMS); coordinate damper control with the building smoke-control sequence per NFPA 92
- FSD Access: Provide code-compliant access doors at every fire/smoke damper for inspection, testing, and reset per NFPA 80 / NFPA 105; all dampers shall be accessible for the periodic operational testing required for healthcare occupancies

8.4.9 Terminal Units and Air Distribution

To maintain effective dehumidification in Puerto Rico's high-humidity tropical climate, the air conditioning system shall be constant air volume (CV). Variable Air Volume (VAV) boxes shall NOT be used. Constant airflow keeps the cooling coil continuously dehumidifying at design face velocity, preventing the rise in space relative humidity that occurs when VAV systems reduce airflow at part load.

- Constant Volume (CV) Terminals: Constant-volume terminal units / constant-volume regulators shall be provided to maintain fixed design airflow to each zone; airflow does not modulate with load
- Temperature Control via Energy Valve: Space and return air temperature shall be controlled by modulating the chilled water flow through the AHU coil using the two-way

energy valve — not by varying airflow. The energy valve throttles chilled water to hold the scheduled return (or supply) air temperature setpoint while airflow remains constant

- Reheat: Where individual zone temperature control or simultaneous dehumidification with reheat is required (e.g., to prevent overcooling while dehumidifying), constant-volume reheat terminals (electric) shall be provided
- Surgical Suite Reheat (REQUIRED): Each surgical suite (each Operating Room) shall be provided with a dedicated duct-mounted electric reheat coil on its supply duct, allowing independent temperature and humidity control for each OR per the surgeon's/procedure's requirements (ASHRAE 170 allows 68–75°F adjustable per room). The electric reheat shall be controlled by the room's setpoint via the central control system, coordinated with the constant-volume airflow and the two-way energy valve at the AHU coil
- ICU Reheat (REQUIRED): The AHUs serving the Intensive Care Units (ICU) shall be provided with electric reheat for independent zone temperature and humidity control of the critical care areas, coordinated with the constant-volume airflow and the AHU two-way energy valve; reheat controlled by zone setpoint via the central control system
- Trauma Stabilization Reheat (REQUIRED): The AHU serving the Trauma Stabilization unit (Ground Level — 16 treatment cubicles + 1 isolation room) shall be provided with electric reheat for temperature and humidity control of this critical care area, coordinated with the constant-volume airflow and the AHU two-way energy valve; reheat controlled by zone setpoint via the central control system
- All OR and isolation room supply air through ceiling diffusers designed for laminar or non-aspirating flow per FGI and ASHRAE 170; OR and isolation rooms remain constant volume to hold required air change rates and pressure relationships at all times
- Air Distribution Grilles and Diffusers (REQUIRED): All supply, return, and exhaust air distribution grilles, registers, and diffusers shall be of aluminum construction for corrosion resistance in Puerto Rico's coastal tropical environment; all grilles and registers shall be provided with opposed-blade dampers (OBD) for individual airflow balancing and shutoff
- Grille/Diffuser Finish: Aluminum finish (mill, anodized, or painted white as required by the interior design) with concealed or visible mounting as suited to the space type; all clinical area grilles shall be smooth and cleanable
- Exterior Louvers (REQUIRED): All outdoor air intake and exhaust louvers shall be aluminum construction, drainable-blade type (to prevent water infiltration), and hurricane-resistant rated. Louvers shall be selected and tested to withstand the design wind loads for Puerto Rico (ASCE 7 / PRBC hurricane exposure) without structural failure or water infiltration at the design wind speed; provide bird/insect screens at all outdoor air intakes

8.4.10 Building Management System (BMS) / DDC Controls

- All units (AHUs, fan coils, DOAS, chillers, pumps) shall be furnished with a complete automatic control system; every chilled water coil shall be controlled by a two-way energy valve (pressure-independent characterized control valve with integral flow measurement and energy/ΔT monitoring)

- Two-way energy valves shall maintain design ΔT, eliminate coil overflow / low-ΔT syndrome, automatically balance flow, and report real-time flow, supply/return temperature, energy consumption, and valve position to the central system
- Control System Architecture: The automatic control system shall be fully centralized in a computer-based system (head-end server with operator workstation/s); all DDC controllers shall report to this central computer over an open-protocol network (BACnet/IP preferred)
- All HVAC equipment shall be integrated into the centralized BMS with Direct Digital Controllers (DDC) per unit, reporting to the central computer system
- BMS shall monitor and control: constant supply airflow and duct static pressure, return/supply air temperature regulated by the two-way energy valve, zone temperature and humidity, CO_2 levels for occupancy-based OA control, AHU filter differential pressure, chiller plant sequencing, two-way energy valve flow and ΔT, DOAS leaving air temperature/dew point and energy recovery operation
- Alarms: All critical parameter deviations (temperature out of range, pressure relationship failure in OR/isolation rooms, filter differential high) shall generate audible and visual alarms at BMS workstation
- OR pressure monitoring: Continuous room pressure monitoring with visual indicators at each OR door
- BMS to integrate with fire alarm system for smoke control and fan shutdown per NFPA 90A

8.4.11 Stair Pressurization and Smoke Control

As a high-rise hospital, the building requires engineered smoke control and stairwell ventilation to keep the means of egress tenable during a fire. The Design-Build Entity shall design these life-safety systems per NFPA 92, NFPA 101, and the building code, coordinated with the fire alarm and the architectural smoke-barrier design.

- Stairwell Pressurization (REQUIRED): Both exit stairwells shall be provided with mechanical pressurization systems to keep the stairs smoke-free during a fire. Dedicated stair pressurization fans (with intake at a clean location) shall maintain a positive pressure in each stairwell relative to the adjacent floors within the range required by NFPA 92 (nominally 0.05 to 0.35 in. w.c. with stair doors closed), so smoke cannot migrate into the egress stairs
- Pressure Relief / Modulation: Each stair pressurization system shall include barometric relief dampers or variable-speed (VFD) fan modulation to maintain the pressure within code limits and to prevent excessive door-opening force (max. 30 lbf per NFPA 101) as doors open and close during evacuation
- Activation: Stair pressurization fans shall start automatically on a general fire alarm / smoke detection signal, on emergency (essential) power, with status and alarms reported to the fire alarm system and the central control system (BMS); manual override at the fire command center
- Elevator Hoistway / Lobby Smoke Control: Provide smoke control for elevator hoistways and the heliport/egress elevator lobbies as required by NFPA 101 and the building code

(pressurization or smoke-protected approach), coordinated with the stair pressurization strategy

- Smoke Control Coordination: HVAC air handling systems shall be interlocked with the fire alarm to execute the smoke-control sequence (fan shutdown, smoke exhaust, and zone isolation via the fire/smoke dampers) per NFPA 90A and NFPA 92; the sequence shall be tested as part of project closeout commissioning

8.5 PLUMBING SYSTEMS

The plumbing system shall serve all domestic cold water, hot water, drainage, waste, vent, and specialty plumbing requirements of the facility. The Design-Build Entity shall design the system to meet FGI Guidelines, IPC (or PRBC equivalent), and ASSE standards.

8.5.1 Water Storage — Cisterns

- Potable Water Cistern: Minimum 30,000 gallons capacity; construction coordinated with structure (the schematic plans show a 30,000-gallon water tank); serves all plumbing fixtures including lavatories, sinks, showers, drinking fountains, water closets, and urinals; supplied from the ASEM main water distribution ring at the main street. The Design-Build Entity shall provide a new potable water meter and service connection from the ASEM water main to the building
- No gray water system shall be provided; all fixtures (including water closets and urinals) shall be served from the potable water system
- The cistern shall be designed for earthquake resistance per structural requirements of the seismic isolation building system
- Cistern shall include: access manholes, overflow drains, and level indicators connected to BMS/central control system
- Cistern Water Level Monitoring (REQUIRED): The potable water cistern water level shall be continuously monitored by the central control system (BMS). A continuous-reading level transmitter (ultrasonic or pressure-type) shall be installed providing real-time level indication at the BMS operator workstation at all times
- Level Alarms: The control system shall generate audible and visual alarms at the BMS for the following conditions: (1) Low Level alarm at a pre-set minimum level to alert operators before the cistern runs critically low and allow time to restore supply; (2) High Level / Overflow alarm to detect overfill or failed fill valve; (3) Loss of level signal alarm (transmitter or communication failure). All alarms shall be logged by the BMS with time-stamp and shall remain active until acknowledged by the operator
- Potable Chlorination System (REQUIRED): A chlorination disinfection system is required for the potable water cistern to maintain a residual disinfectant and ensure water quality. The system shall provide automatic chlorine dosing with residual monitoring, proportioned to flow/storage, and shall maintain the chlorine residual required by the Puerto Rico Department of Health. The Design-Build Entity may provide supplemental UV disinfection, but chlorination is the required primary disinfection method. Chlorination equipment,

dosing pumps, and residual analyzers shall be integrated into the central control system with low-residual alarm

8.5.2 Domestic Water Pumping

Water closets and urinals shall use flush valves (flushometer / direct-flush) rather than flush tanks. Flush valves draw a high instantaneous flow (approximately 25 GPM per water closet for a few seconds) directly from the piping and require a higher minimum flowing pressure at the fixture. The domestic water booster system and distribution piping shall be sized for this higher peak instantaneous demand and minimum pressure.

- Demand basis: System peak demand shall be calculated using flush-valve water supply fixture unit (WSFU) values per the flush-valve column of the plumbing code/Hunter's curve (a flush-valve water closet ≈ 10 WSFU vs. ≈ 5 WSFU for a tank type); the higher diversified peak flow shall govern pump and pipe sizing
- Potable Water Pumps: Centrifugal end-suction, vertical discharge, TEFC motors; configuration: variable-speed (VFD) booster set with one (1) standby pump (minimum). The booster set shall be sized for the flush-valve peak flow — horsepower and number of pumps to be determined by the Design-Build Entity's hydraulic calculation (the previously cited 10 HP is a minimum starting point and will likely increase with flush-valve demand)
- Pressure: Maintain minimum flowing pressure at every fixture adequate for flush-valve operation — minimum 25–35 psi residual at the most hydraulically remote flush valve (per manufacturer), and minimum 40 psi at standard fixtures; maximum 80 psi (PRVs per ASSE 1003). The high-zone booster shall account for the flush-valve minimum at the topmost floor
- Multiplexed booster pumps and/or a hydropneumatic tank shall be considered to handle the rapid, intermittent flush-valve flow spikes without pressure sag; the Design-Build Entity shall confirm the configuration based on hydraulic analysis
- Automatic lead-lag with standby pump auto-start on failure
- BMS Connection (REQUIRED): The potable water pumping/booster system shall be connected to and monitored by the Building Management System (central control computer). The BMS shall monitor and report pump status (run/standby/fault), system pressure in both risers, VFD speed/output, flow, hydropneumatic tank pressure, and shall annunciate alarms for low pressure, pump failure, and standby pump activation

8.5.3 Domestic Water Vertical Distribution — Dual Risers (Pressure Zones)

The potable water distribution shall be divided into two (2) independent vertical risers, zoned by building height to manage static pressure and provide distribution redundancy:

- Riser No. 1 — Low Zone: Serves Floors 1 through 4 (Ground/First through Fourth Levels)
- Riser No. 2 — High Zone: Serves Floors 5 through 9 (Fifth through Ninth Levels)
- Each riser shall be independently valved and isolatable at the base and at each floor takeoff, allowing maintenance of one zone without affecting the other
- Pressure zoning: The high-zone riser shall be boosted/regulated to deliver adequate pressure to the upper floors, including the minimum flowing pressure required for flush

valves at the topmost floor; pressure reducing valves (PRVs) shall limit pressure on lower floors of each zone to a maximum of 80 psi per code; the two-zone arrangement prevents excessive static pressure at the lowest fixtures while ensuring flush-valve minimum pressure at the highest fixtures

- The Design-Build Entity shall confirm final zone breakpoint and booster staging based on hydraulic calculations and the building height/static head

8.5.4 Domestic Water Distribution Piping

- All piping materials shall conform to the Plumbing Pipe Material Schedule below. Fittings shall be welded or Viega Propress type for copper; glue or compression welded for PVC.

Plumbing Pipe Material Schedule

Type of Service	Min Dia. (in)	Max Dia. (in)	Aboveground Material	Underground Material	Fitting Characteristics
City Water Hot or Cold	1/2"	2"	Rigid Copper Type L, Seamless ASTM B88	Rigid Copper Type K, Seamless ASTM B88	Welded or Viega Propress
	2-1/2"	4"	Ductile Cast Iron, AWWA C-151	Ductile Cast Iron, AWWA C-151	
Sanitary and Ventilation	2"	6"	PVC SCH 40 DR22, ASTM D2665	4" and smaller: PVC SCH 40 6" and larger: SDR 14-PR	Glue or Compression Welded

- Hot Water Supply: Recirculating hot water system; max. 0.5 gal. wait time at fixture per FGI Guidelines for hospital facilities
- Hot Water Vertical Distribution — Dual Risers: Two (2) independent hot water supply risers zoned to match the potable cold water pressure zones — Riser No. 1 serving Floors 1–4 (low zone) and Riser No. 2 serving Floors 5–9 (high zone) — maintaining balanced cold/hot pressures at thermostatic mixing valves and allowing one zone to be isolated for maintenance without affecting the other
- Hot Water Recirculation Returns: Each hot water supply riser shall have a dedicated recirculation return riser (two HWS + two HWR risers total); recirculation pumps maintain continuous circulation per zone for the 0.5-gallon FGI wait time and the minimum 120°F system temperature for Legionella control (ASHRAE 188), with zone-by-zone thermal disinfection capability and BMS monitoring of recirculation pumps and zone temperatures
- Hot Water Temperature: Generate at 120°F minimum; distribute at 110°F to patient-accessible fixtures (thermostatic mixing valves per ASSE 1017); scald protection at 110°F max at patient showers and lavatories
- Anti-Scald and Backflow Prevention devices per ASSE 1010, ASSE 1017, ASSE 1070 as applicable

8.5.5 Hot Water Generation

- Potable hot water shall be generated by LPG (liquefied petroleum gas / propane) fired water heaters; minimum two (2) units for redundancy (N+1 configuration)

- LPG storage: Bulk propane storage tank(s) located at exterior grade-level pad with separation distances and safety requirements per NFPA 58 (Liquefied Petroleum Gas Code); coordinate tank sizing, location, and refueling access with Owner and AHJ
- LPG piping and combustion venting per NFPA 54 (National Fuel Gas Code); gas detection and shutoff at water heater room
- Water heaters sized for peak hospital domestic hot water demand with adequate storage; provide hot water storage tanks as required
- Legionella control: System shall be designed and operated per ASHRAE 188 — Legionellosis: Risk Management for Building Water Systems
- Thermal disinfection capability (periodic flush at 160°F) required

8.5.6 Pipe Insulation

- All domestic hot water supply and return piping shall be insulated per the Plumbing Piping Insulation Schedule below. Cold water piping in unconditioned spaces or ceiling plenums shall be insulated with vapor barrier to prevent condensation in Puerto Rico's humid climate. All insulation materials shall comply with Flame Spread <=25 and Smoke Developed <=50 per ASTM E84.

Plumbing Piping Insulation Schedule

Temp. Range (F)	Min Dia. (in)	Max Dia. (in)	Thickness	K Value	Material Type	Exterior Finish	Interior Finish	Int. Exposed Finish

8.5.7 Drainage, Waste, and Vent (DWV)

- Sanitary drainage: Cast iron hub-and-spigot or no-hub per ASTM A74; all below-slab piping to be cast iron
- Vent system: Individual and circuit venting per code; roof penetrations for all vent terminals min. 10 ft. from air intakes
- Acid waste drainage: Chemical-resistant piping (polypropylene or PVDF) for all laboratory and imaging department sinks with neutralization tanks before connection to sanitary system
- Floor drains in all soiled utility rooms, janitor closets, equipment rooms, ORs, procedure rooms, and bathrooms
- Grease interceptor for cafeteria/kitchen waste as required by local authority
- Basement Sump Pit — Storm Water Ejector System (REQUIRED per Sheet A-1.1): The basement foundation slab shall be provided with a sump pit as indicated on the architectural foundation plan (Sheet A-1.1). The sump pit shall collect groundwater infiltration, mechanical equipment condensate overflow, floor drain drainage, and any stormwater that may accumulate in the basement level. Given Puerto Rico's high water

table, intense tropical rainfall events, and the below-grade nature of the basement slab, a properly designed sump and ejector system is essential for the protection of the building structure, mechanical equipment, and electrical systems.

- Sump Pit Construction: The sump pit shall be constructed in the basement foundation slab at the lowest point of the basement floor, as indicated on Sheet A-1.1. Minimum sump pit dimensions: 24 inches diameter by 36 inches depth, precast concrete or fiberglass liner, with removable grated cover at floor level. The pit shall be sealed against groundwater infiltration between the liner and the slab. A check valve shall be provided on each pump discharge to prevent backflow into the pit.
- Duplex Submersible Storm Pump System (RECOMMENDED): Provide a duplex (2-pump) system of submersible storm water ejector pumps — one (1) duty pump + one (1) standby pump — installed in the sump pit. Duplex configuration provides N+1 redundancy to protect the basement from flooding during pump failure or maintenance. Each pump shall be sized to handle the calculated peak inflow rate with a minimum 25% safety margin. Pump selection shall be based on a hydrology analysis of the basement drainage area including floor drains, condensate, and potential groundwater infiltration at the project site.
- Storm Pump Performance Requirements: Each submersible storm pump shall be capable of: (1) total dynamic head sufficient for forced discharge from the basement level to the exterior municipal storm drain network at the street, accounting for elevation difference, pipe friction losses, and pipe length; (2) minimum 50 GPM capacity each (or as calculated by the hydrology analysis, whichever is greater); (3) automatic float-switch operation with high/low/override float levels; (4) oil-free motor suitable for continuous submerged operation; (5) stainless steel or cast iron pump body with corrosion-resistant coating for tropical environment.
- Discharge Piping: Storm pump discharge piping shall be Schedule 40 PVC or ductile cast iron, with check valves and isolation gate valves at each pump discharge. Individual pump discharges shall join in a common header before exiting the building. The discharge shall be directed to the exterior municipal stormwater system (street storm drain network) as required by local authority. Backflow prevention shall be provided at the building exterior connection to prevent street flooding from backing up into the basement sump.
- Controls and BMS Integration: The duplex pump system shall include an automatic alternating control panel (lead-lag) with manual override for each pump. The control panel shall include: (1) automatic alternation of lead/lag pump to equalize wear; (2) simultaneous operation of both pumps on high-water alarm; (3) visual alarm indicator and audible alarm at the panel; (4) BMS monitoring points — pump run status (each pump), high-water alarm, pump failure alarm, and sump water level (continuous or float-based) — all reported to the central BMS operator workstation with alarm annunciation. A high-water alarm shall also be annunciated at a 24-hour monitored location per the Owner's facilities management protocol.

8.5.8 Specialty Plumbing

- Emergency eyewash and shower stations at locations per ANSI Z358.1 — pharmacy, laboratory, and all hazardous material storage areas
- Medical equipment connections (ice machines, water purification for dialysis/imaging) by Design-Build Entity per equipment schedule
- Roof drainage: Primary and overflow (emergency) roof drains per IPC; no combination with sanitary system
- Emergency Generator Diesel Fuel: The schematic plans show a 20,000-gallon diesel storage tank in the Second Level Mechanical Roof Yard serving the emergency generators. The Design-Build Entity (mechanical) shall coordinate the diesel fuel piping, day tanks, tank venting, spill containment, and leak detection per NFPA 30 and NFPA 110, in coordination with the electrical/generator scope; fuel-oil system to be designed for the hurricane-resilient run time required for a Category 1 facility

8.5.9 Plumbing Controls — DDC / BMS

- DDC controllers on all pumps reporting to the centralized computer-based control system
- BMS shall monitor and control: water flow and system pressure in both potable risers, potable cistern level (high/low alarms), hot water temperature, booster pump status and alarms, backflow preventer test reporting

8.6 FIRE PROTECTION SYSTEMS

The fire protection system shall provide automatic sprinkler protection throughout the entire facility in accordance with NFPA 13 and the requirements of NFPA 99 for health care occupancies. The system shall be designed as a wet pipe system throughout, except where special hazards or clinical constraints require alternate systems.

8.6.1 Fire Water Cistern

- Capacity: Minimum 36,000 gallons; dedicated exclusively to fire protection system
- Construction: Underground reinforced concrete; seismic design per structural requirements
- Water Supply: The fire protection water supply shall be taken from the ASEM main water distribution ring at the main street. The Design-Build Entity shall provide a new dedicated 4" fire service meter and connection from the ASEM water main to the fire cistern. Rainwater collection shall be provided as supplemental supply to ensure resilience during emergencies and hurricanes
- The cistern shall maintain full capacity at all times; automatic refill with low-level alarm at BMS/fire command center
- Rainwater Collection System (REQUIRED): The fire protection cistern shall be supplemented by a dedicated rainwater collection and storage system. Rainwater shall be collected from the building roof and rooftop mechanical areas and directed to the fire

cistern as a supplemental water supply source. This provides resilience during emergencies and hurricanes when the ASEM water main may be interrupted.

- Rainwater Collection Infrastructure: The rainwater collection system shall include: (1) roof drainage leaders from designated collection areas routed to a pre-filtration and first-flush diverter assembly before entering the cistern — first flush of minimum 0.1 gallon per square foot of collection area shall be diverted to sanitary drain to remove contaminants; (2) a coarse filtration screen (minimum 100-mesh stainless steel) at the cistern inlet to prevent debris entry; (3) an overflow connection from the cistern to the storm drain system; (4) collection piping sized for the 10-year design storm event for San Juan, Puerto Rico.
- Cistern Capacity and Water Quality: The 36,000-gallon fire cistern capacity includes provision for rainwater collection volume. Water in the fire cistern shall not be used for potable purposes. No cross-connection with the potable water system is permitted. All connections between the rainwater collection system and fire cistern shall include air gaps or reduced-pressure backflow preventers per applicable plumbing code.
- BMS Monitoring: The rainwater collection system inlet valve and cistern level shall be monitored by the BMS. Alarms shall annunciate at the fire command center and BMS for: (1) low cistern level (below 75% capacity); (2) inlet filter clogged condition; (3) first-flush diverter malfunction. The cistern shall automatically refill from the ASEM water main when the level drops below the low-level setpoint.

8.6.2 Fire Pumps

- Type: Diesel engine-driven, split-case horizontal centrifugal
- Performance: Minimum 1,000 GPM at 150 PSI rated working pressure
- Diesel Tank: Integral tank with minimum 500-gallon capacity (minimum 8-hour run time at full load)
- Configuration: Primary fire pump + electric jockey (pressure maintenance) pump; consider diesel backup electric pump for N+1 per AHJ requirements for critical care facility
- Installation per NFPA 20; fire pump room shall have 2-hour fire-rated construction, dedicated ventilation, and drainage pit

8.6.3 Sprinkler System

- System Type: Wet pipe automatic sprinkler throughout; pre-action system in electrical/data rooms and MRI (if applicable)
- Pipe: Victaulic grooved-end carbon steel Schedule 10 (for mains); Schedule 40 where required by code; no plastic piping in clinical areas
- Design Standard: NFPA 13; hydraulically calculated per system type; Light Hazard (patient rooms, corridors), Ordinary Hazard Group 1 (mechanical/utility rooms, storage)
- Sprinkler heads: Concealed type in all patient care areas and public spaces; upright/pendent in mechanical rooms; quick-response heads in all occupied areas per NFPA 13
- No sprinklers in electrical switchgear rooms, transformer vaults, MRI rooms (coordinate with Owner); provide alternative protection as required by AHJ

- Clean Agent Fire Suppression — FM-200 System (REQUIRED for Server Rooms / Data Rooms): All server rooms, data rooms, and telecommunications rooms (IT rooms) in the facility shall be protected by a dedicated clean agent fire suppression system using FM-200 (HFC-227ea) as the suppression agent, in lieu of water-based sprinkler or pre-action systems. FM-200 is a gaseous clean agent that suppresses fire rapidly without water, foam, or residue — protecting critical electronic equipment, data, and servers from both fire and water damage. No wet-pipe or pre-action sprinkler systems shall be installed in rooms protected by FM-200.
- FM-200 System Design Standard: The FM-200 clean agent system shall be designed, installed, tested, and maintained per NFPA 2001 — Standard on Clean Agent Fire Extinguishing Systems (current edition) and the FM-200 (HFC-227ea) manufacturer's specifications. The system shall achieve the minimum design concentration of 7.9% v/v (or as required per NFPA 2001 for the specific hazard) throughout the protected enclosure volume, including below raised floor and above suspended ceiling if present.
- FM-200 System Components: Each protected room shall include: (1) FM-200 cylinder storage assembly with solenoid-actuated valve and pressure gauge; (2) distribution piping and discharge nozzles designed per NFPA 2001 to achieve uniform agent distribution throughout the room volume; (3) dedicated fire detection — cross-zoned smoke detectors (minimum two (2) detection devices required to actuate discharge to prevent accidental activation) connected to the fire alarm panel per NFPA 72; (4) manual discharge station and manual abort station at the room exit; (5) pre-discharge alarm — audible and visual warning devices (horn/strobe) inside the protected room activating before agent discharge to allow room evacuation; (6) door holders releasing on alarm to close all doors before discharge; (7) room integrity seal — all penetrations, cable entries, and gaps in the enclosure shall be sealed to maintain agent concentration for the required 10-minute hold time per NFPA 2001.
- Room Enclosure Requirements: For FM-200 to be effective, the protected rooms shall be constructed as reasonably tight enclosures. All wall, floor, and ceiling penetrations (conduit, pipe, cable trays) shall be sealed with listed fire-stopping materials that also serve as air seals. A door fan pressurization test (enclosure integrity test per NFPA 2001 Annex B) shall be performed prior to system acceptance to verify the room can hold the design FM-200 concentration for the required hold time.
- FM-200 Cylinder Sizing and Refill: FM-200 cylinders shall be sized for the total calculated agent quantity required to achieve design concentration in each protected room, plus a minimum 10% safety margin. Cylinder quantity and storage location shall be coordinated with the structural engineer for floor loading. A re-fill service contract and agent refill plan shall be submitted with the O&M manuals. The D&B Contractor shall confirm FM-200 (HFC-227ea) availability and compliance with any applicable EPA SNAP program listings at the time of procurement.
- BMS and Fire Alarm Integration: The FM-200 system shall be fully integrated with the building fire alarm system (NFPA 72). Pre-discharge warning, agent discharge, system trouble, and abort conditions shall all report to the fire alarm control panel and to the BMS operator workstation. The fire alarm system shall simultaneously initiate: (1) HVAC

shutdown for the protected room (close supply and return dampers to prevent agent dilution and discharge to other areas); (2) activation of pre-discharge alarm inside the room; (3) door holder release to close the room doors before discharge. All FM-200 system wiring, conduit, and detection devices shall be installed by a licensed fire protection contractor.

8.6.4 Standpipe System

- Class I standpipe system per NFPA 14 (fire-department-use 2½" hose connections; the building is fully sprinklered per NFPA 13). The building has two (2) stairwells; a standpipe riser shall be provided in each of the two stairwells (one riser per stair), providing full hose coverage and riser redundancy per NFPA 14
- The two standpipe risers shall be interconnected at the base (looped at the bottom and fed from the fire pump discharge) so that the system remains supplied if one riser is isolated; interconnection arranged per NFPA 14
- 2½" hose valve connections at each floor landing in each stairwell; 1½" hose connections at hose cabinets in corridors as required
- Fire Department Hose Valves: Class I 2½" fire department hose connection valves shall be provided at each floor landing in each stairwell per NFPA 14, for fire department use
- Fire Department Connection / Siamese (FDC) — REQUIRED: A fire department connection (siamese two-way inlet) shall be provided at the exterior building perimeter, accessible to fire department apparatus, to allow the fire department to pump water (boost pressure) into the standpipe/sprinkler system. Minimum two (2) FDC locations serving the interconnected standpipe risers; each FDC with check valve, automatic drip/ball drip, and identification signage per NFPA 14

8.6.5 Controls and Monitoring

- All control valves: Supervised open (tamper switches) reporting to fire alarm panel (NFPA 72)
- Flow switches at each floor and zone; waterflow alarms reporting to fire alarm panel
- Fire pump controller: Listed per NFPA 20; alarms (pump start, loss of power, phase failure) reporting to fire alarm and BMS
- Hydraulic calculations and water supply analysis (flow test from the ASEM water main) required as part of D&B design deliverables; the Design-Build Entity shall coordinate with ASEM facilities to confirm available flow and pressure at the point of connection

8.7 MEDICAL GAS SYSTEMS

Medical gas systems shall be designed, installed, and tested in accordance with NFPA 99 (Health Care Facilities Code), latest edition, Category 1 requirements for Hospital-level facilities, and the FGI Guidelines. All medical gas systems are life-safety systems and shall be treated accordingly.

The Design-Build Entity shall engage a medical gas installer with current ASSE 6010 certification. The final certification of all medical gas and vacuum systems shall be performed by an independent, third-party Medical Gas Systems Verifier certified to ASSE 6030 prior to system activation and Owner acceptance.

8.7.1 Medical Gases Required

Gas / Vacuum	Symbol	Pipe Color	Primary Use Locations
Medical Oxygen (O_2)	O2	Green	All patient rooms, ORs, ICU, ED, Procedure Rooms
Medical Vacuum (WAGD / Suction)	VAC	White	All patient rooms, ORs, ICU, ED
Medical Air (MA)	MA	Yellow	ORs, ICU, Procedure Rooms, Vents
Nitrous Oxide (N_2O)	N2O	Blue	ORs, Minor Procedure Rooms (if applicable)
Nitrogen (N_2)	N2	Black	Surgical power tools in ORs
Carbon Dioxide (CO_2)	CO2	Gray	Laparoscopic ORs (if applicable)
Waste Anesthesia Gas Disposal (WAGD)	WAGD	Magenta	All ORs and anesthetizing locations

8.7.2 Medical Gas Source Equipment

8.7.2.1 Medical Oxygen — PSA Generation Plant

- Medical oxygen shall be generated on-site by a Pressure Swing Adsorption (PSA) oxygen generation plant that produces oxygen from ambient air, in compliance with NFPA 99 requirements for oxygen concentrator supply systems and USP / CGA oxygen 93 purity standards
- Configuration: Duplex (N+1) PSA generators with automatic alternating operation; each generator sized to meet 100% of peak demand independently so the facility remains supplied during maintenance or single-unit failure
- Air supply: Dedicated oil-free air compressors (duplex/redundant) with air treatment train — filtration, drying, and buffer/feed air receivers — upstream of the PSA generators
- Oxygen storage: Product oxygen buffer/storage tank(s) sized to provide adequate reserve and stable supply during PSA cycling and peak demand
- Reserve / backup source: A reserve supply of high-pressure oxygen cylinders (manifold with automatic switchover) shall be provided per NFPA 99 to serve the facility automatically in the event of total PSA plant failure; reserve sized for the duration required by NFPA 99 and the AHJ for a Category 1 system
- Continuous oxygen concentration monitoring with alarm; low-concentration condition shall trigger master alarms and, if required, automatic changeover to the cylinder reserve source

- PSA plant room: Adequately ventilated, located per NFPA 99 separation and safety requirements; coordinate room location, ventilation, and electrical (essential power) with the D&B design
- Emergency Oxygen Supply Connection (EOSC): An emergency oxygen supply connection shall be provided on the exterior of the building, accessible to emergency vehicles, per NFPA 99. The EOSC allows a temporary/auxiliary oxygen source (mobile liquid oxygen trailer or cylinder truck) to be connected to supply the building's oxygen piping system if the PSA plant and cylinder reserve are both unavailable. The connection shall include the required check valves, shutoff valves, and labeling per NFPA 99
- Redundant Connection to Existing ASEM Hospital: A cross-connection to the medical oxygen system of the existing ASEM Central Services Building shall be provided as an additional redundant source. This interconnection — with appropriate isolation valves, check valves, and pressure regulation — shall allow either facility to supply oxygen to the other in an emergency. The Design-Build Entity shall coordinate the tie-in point, capacity, and controls with ASEM facilities and confirm that the combined demand does not compromise either building's supply
- Source priority: The control/alarm system shall manage source sequencing — primary PSA plant, then cylinder reserve, then existing-hospital interconnection and/or exterior emergency connection — with automatic or manual changeover and master alarm annunciation per NFPA 99
- Oxygen supply pressure: 50–55 PSI at zone valve outlets
- Line pressure regulators and relief valves per NFPA 99

8.7.2.2 Medical Air Compressors

- Medical air compressor system: Oil-free, triplex configuration (three compressors), automatic alternating/sequencing, sized so the system meets full peak demand with one or more compressors out of service per NFPA 99 Category 1
- Air Dryers — Desiccant Type: The medical air system shall use desiccant (regenerative) air dryers to achieve a low pressure dew point, with duplex (redundant) dryers, coalescing pre/after filters, and dew point monitors; desiccant dryers are required for the low dew point and reliable moisture removal needed in Puerto Rico's high-humidity climate
- Receiver tank sized per NFPA 99 Category 1 requirements
- Air purity: Meets CGA G-7.1 Grade E medical air quality; CO and dew point monitor alarms required

8.7.2.3 Medical Vacuum

- Medical vacuum shall be a centralized, modular vacuum plant with four (4) pumps in a quadruplex configuration; the modular arrangement allows individual pump maintenance without taking the system offline, and provides redundancy beyond the NFPA 99 minimum
- Pump Type: Oil-sealed (oil-recirculating) liquid/rotary vane vacuum pumps, continuous duty, with the required oil separation and exhaust treatment per NFPA 99
- VFD Control: Each vacuum pump shall be driven by a variable frequency drive (VFD) to modulate capacity to match demand, reduce energy consumption, and lessen wear;

pumps shall stage and rotate automatically (lead/lag/standby sequencing across the four units)

- Configuration: Quadruplex — sized so the system maintains full rated vacuum with one or more pumps out of service per NFPA 99 Category 1 demand and redundancy requirements
- Vacuum level: 12–15" Hg below atmospheric minimum at the inlet of any station outlet
- Vacuum receiver tank, bacterial/inlet filtration, and exhaust to atmosphere at a safe location per NFPA 99; exhaust away from air intakes and occupied areas
- WAGD system: Separate dedicated system from medical vacuum; active WAGD (venturi or blower) per NFPA 99

8.7.3 Medical Gas Distribution Piping

- Piping material: Seamless copper tube, cleaned and capped per ASTM B819 (internally cleaned for oxygen service) — Type K for main and riser piping, and Type L for branch piping to outlets
- All joints: Brazed (silver-phosphorus alloy) in nitrogen purge environment; no solder, compression, or push-fit fittings
- Pipe identification: Color-coded per NFPA 99 and labeled at all outlets, valves, and branch points
- Zone valves (Area Isolation Valves): Per NFPA 99, located in labeled, locked valve boxes in corridors with gauges, for every gas/vacuum service. Minimum arrangement:
  - Patient Care Floors: Two (2) medical gas zone valve assemblies per patient floor — one serving each nursing wing (east wing and west wing) — so either wing can be isolated independently without interrupting the other
  - Operating Rooms: Each Operating Room shall have its own dedicated zone valve assembly, located outside the OR in the corridor, so any single OR can be isolated for maintenance or emergency without affecting the other ORs (per NFPA 99)
  - Other clinical areas (ICU, Trauma Stabilization, ED, Imaging, Procedure Rooms): zone valves per nursing unit / clinical area as required by NFPA 99

8.7.4 Outlet Stations (Head Walls / Boom)

- All outlets: DISS (Diameter-Index Safety System) per NFPA 99 — gas-specific, non-interchangeable connections
- Outlet quantities per room type to comply with FGI Table 2.1-3 (minimum):
  - Trauma OR: O_2 (3), VAC (3), MA (2), N_2O (1), N_2 (1), WAGD (1)
  - Trauma ICU Private Room: O_2 (2), VAC (2), MA (1)
  - Trauma Stabilization Cubicle: O_2 (2), VAC (2), MA (1)
  - Minor Procedure Room: O_2 (2), VAC (2), MA (1)
  - Patient Room (Med-Surg, Telemetry, Rehab): O_2 (2), VAC (2) — Double station per room to accommodate surge capacity of two (2) beds per room per NFPA 99
- Final outlet schedule to be submitted by Design-Build Entity as part of SD deliverable

8.7.5 Medical Gas Alarms

- Master Alarm Systems (REQUIRED): Two (2) independent master alarm systems/panels per NFPA 99 — located at two separate, continuously monitored locations (e.g., the Disaster Control/Monitoring Center on Level 9 and a 24-hour-occupied primary nursing station / facility engineering). The two master alarms shall be wired on independent circuits so that failure of one does not disable the other; each monitors all source equipment and main line conditions for every medical gas and vacuum system
- Area Alarm Panels (REQUIRED): One (1) area alarm panel per floor or per zone served, located at the nursing station or at the entrance of each zone per NFPA 99; each area alarm monitors the pressure of every medical gas/vacuum serving that floor or zone downstream of the area (zone) isolation valves
- Alarms per NFPA 99: High/low pressure alarms for all gas systems; vacuum level alarms; source equipment failure alarms; WAGD system alarms
- Master Alarm BMS Connection (REQUIRED): The medical gas master alarm system shall be connected to the Building Management System (central control computer) for centralized monitoring and reporting. All master alarm conditions (source equipment status, main line pressures, all gas/vacuum systems) shall be reported to and annunciated at the BMS, in addition to the dedicated master alarm panels. The BMS connection is supplementary to — and shall not replace or compromise — the dedicated, code-required NFPA 99 master alarm panels and their independent wiring
- All alarms integrated into BMS and connected to nurse call / facility emergency notification system

8.7.6 Medical Gas Testing and Certification

- All medical gas piping systems shall be tested per NFPA 99 including: initial blowdown, pressure testing, cross-connection testing, purity testing, and flow testing at each outlet
- Final certification by an independent third-party Medical Gas Systems Verifier (ASSE 6030 certified) is required prior to Owner acceptance and system activation; the verifier shall be independent of the installing contractor per NFPA 99
- Design-Build Entity to submit a Medical Gas Commissioning Plan at DD phase

8.8 ENERGY AND SUSTAINABILITY REQUIREMENTS

- LEED certification is optional and at the discretion of the Design-Build Entity — it is not a mandatory project requirement. The mechanical systems shall nonetheless incorporate energy-efficient and sustainable design practices (high-efficiency equipment, energy recovery, VFDs, water conservation) consistent with the project design intent, whether or not LEED certification is pursued
- Energy efficiency: The mechanical systems shall incorporate high-efficiency equipment, energy recovery, VFDs, and water conservation practices consistent with the project design intent; energy modeling is not required

- Energy Recovery: Total energy recovery (enthalpy wheel or membrane) on all DOAS units serving outdoor air to AHUs and fan coils (minimum 60% effectiveness)
- VFDs: Required on all AHU fans, chilled water pumps, condenser water pumps, and cooling tower fans
- Water Conservation: Water closets and urinals shall use flush valves (flushometers) with low-consumption flush volumes (e.g., 1.28 gpf water closets, 0.125–0.5 gpf urinals) per LEED WE requirements; low-flow lavatories and showers; rainwater collection is utilized for the fire protection cistern
- Commissioning: Full mechanical commissioning (Cx) by Owner's Commissioning Agent (CxA) required; Design-Build Entity to provide a Commissioning Plan and coordinate with CxA throughout design and construction
- Metering: Energy and water sub-metering per LEED and FGI requirements; all data to integrate with BMS

8.9 INTERFACE WITH EXISTING ASEM CENTRAL SERVICES BUILDING

The proposed Trauma Hospital will be structurally and functionally integrated with the existing ASEM Central Services Building at three (3) levels. The Design-Build Entity shall:

- Survey and document all existing mechanical systems at the interface levels prior to design
- Coordinate with ASEM facilities management for all tie-ins or disconnections of existing mechanical systems
- Ensure no interruption to active medical gas, HVAC, or plumbing services serving the existing hospital during construction — a detailed Infection Control Risk Assessment (ICRA) and Interim Life Safety Measures (ILSM) plan shall be submitted prior to any work adjacent to occupied areas
- The corridor connector at Level 2 to ASEM Central Services Building shall be provided with appropriate mechanical services (HVAC, fire sprinkler) designed for the connector space
- Coordinate relocation of existing ASEM Emergency Department ambulance entrance, drop-off, and waiting area services — all MEP systems to be expanded and relocated into the new building per the program
- Medical oxygen cross-connection: Coordinate the redundant medical oxygen interconnection between the new Trauma Hospital and the existing ASEM building (see Section 7.2.1), including tie-in location, isolation/check valves, pressure regulation, and joint operating procedures with ASEM facilities

8.10 DESIGN-BUILD ENTITY SCOPE AND KEY DESIGN CONSTRAINS

8.10.1 Items Fully in Design-Build Entity Scope

- Mechanical design by a Professional Engineer (PE) licensed in Puerto Rico and an active member of the Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR); all drawings and design documents signed and sealed by the Puerto Rico-licensed PE
- All mechanical systems described in this Bridge Document from source equipment through final connections at each room outlet or device
- Coordination with structural design for all equipment pads, roof curbs, penetrations, and seismic restraints
- All permits, inspections, and regulatory approvals for mechanical systems
- Building Management System (BMS) complete with all point connections described herein
- If LEED certification is pursued (optional), LEED documentation for all mechanical-related credits
- Training of Owner's facilities staff on all mechanical systems (minimum 8 hours per system)

8.10.2 Key Design Constraints

- All mechanical systems must be designed to remain operational after a seismic event of the design level; the building utilizes a seismic isolation plane at the Interstitial Level — all piping and duct crossing this plane must use flexible seismic connectors
- The Heliport (Roof Level) creates restricted airspace above the building — all rooftop mechanical equipment must comply with FAA and PRASA height and clearance restrictions for heliport operations
- The Second Level Mechanical Roof Yard houses the cooling towers and the 20,000-gallon emergency generator diesel tank; all equipment in this yard shall have stainless steel/marine-rated construction, hurricane wind-load anchorage, seismic restraints coordinated with the building isolation system, and acoustic treatment given the adjacency to patient floors above and the auditorium/terrace
- Infection Control Risk Assessment (ICRA) Class III or IV measures required for all work adjacent to or within the existing ASEM building
- Puerto Rico's tropical climate (high humidity, hurricane exposure) must be considered in all equipment, material, and control selections; all exterior equipment shall be rated for hurricane wind loads and coastal corrosion resistance

Attachment D: SARPS Recommendations

The Design-Builder shall incorporate, as an integral part of the design, engineering, and development of the project, all recommendations issued by SARPs detailed below. These recommendations will be considered contractual requirements and must be fully integrated, coordinated, and reflected in the design documents, technical specifications, IFC drawings, construction, testing, and commissioning plans. The Design-Builder will be responsible for their correct implementation and for ensuring that these recommendations comply with applicable standards, codes, regulations, and performance criteria established for the project.

1. The Design-Builder must comply with all requirements set forth in the FGI Hospital Design and Construction Guidelines, in their current edition at the time the construction plans, or any major modifications to the physical structure, are endorsed. The Design-Builder must pay particular attention to the criteria, standards, and guidelines applicable to the type of healthcare facility being projected, as well as all clinical, operational, patient safety, and hospital infrastructure requirements contained in these guidelines.

    a. The site design shall provide a signed route from public roads that directs ambulance traffic to the ambulance entrance to the emergency department and vehicle traffic to the public entrance.

    b. Paved emergency access to permit discharge of patients from automobiles and Ambulances shall be provided.

    c. The emergency department entrance shall be clearly marked. A well-marked, illuminated, and covered entrance shall be provided at grade level.

    d. If a raised platform/dock is used for ambulance discharge, a ramp or elevator/lift to grade level shall be provided for pedestrian and wheelchair access.

    e. The emergency vehicle entry cover/canopy shall provide shelter for both the patient and the emergency medical crew during transfer between an emergency vehicle and the building.

    f. The emergency bays should be sized so they are compatible with horizontal and vertical vehicle clearances of EMS providers as required.

g. Emergency department ambulance entrances shall provide a minimum of 6 feet (1.83 meters) in clear width to accommodate bariatric stretchers, mobile patient lift devices, and accompanying attendants.

h. If required by the patient handling and movement assessment (PHAMA), bariatric lifts shall be available.

i. If bariatric lifts are provided in the covered ambulance bay, they shall be positioned to help with patient transfers.

j. The amount of janitors will be evaluated to ensure it meets the need.

2. In all handwashing stations (patient room bathrooms, public bathrooms, staff bathrooms) and in (clean) staff handwashing stations, equal or similar of the Bobrick Model B-262 (mkd 1) Surface Mounted Paper Towel Dispenser must be evaluated.

    a. Handwashing stations in patient care areas must be in a visible and unobstructed area and equipped with hand-free controls.

    b. If the handwashing station includes a cabinet, it must be designed to prevent storage under the sink.

    c. Handwashing stations must include a hand-drying device that does not require hands to come into contact with the dispenser.

    d. The hand-drying device must be fully enclosed to protect against dust or dirt and to ensure single-unit dispensing. It must operate in a way that requires only touching a towel.

3. Paper towel dispensers must be directly accessible next to the sink (on the same wall as the sink), not on the opposite wall or on any other wall where one has to cross a space because the floor gets wet and there may be a risk of slipping and falling.

4. Hand drying devices (hand dryer mkd 4) - Must be directly accessible next to the sink (on the same wall where the sink is located), they must not be located on the opposite wall from where the sink is located or on any other wall where you have to cross a space because the floor gets wet and there may be a risk of slipping and falling.

5. In all patient restrooms, public restrooms and staff restrooms, the following should be evaluated: equal or similar of Surface-Mounted Toilet Tissue Dispenser Two Rolls Bobrick Model B-69997 (mkd 5).

   Evaluate hospital use, preferably fully enclosed so that the lid cannot be lifted and the paper touched, and to protect against dust or dirt.

6. In all applicable bathrooms, the equal or similar Bobrick Model B-3949 (mkd 15) Paper Towel Dispenser and Waste Receptacle must be evaluated for hospital use, a separate, lidded, step-on type waste bin is preferred. If a paper towel dispenser for hands is to be provided, in addition to the hand dryer, it must be fully enclosed to protect against dust or dirt and to ensure single-unit dispensing. It must operate in a way that requires only touching a towel.

7. All finishing materials for countertops, shelves, and cabinet doors must be hospital-grade, easy to clean and disinfected, and selected to withstand impact damage and cleaning with EPA-registered hospital disinfectants. Wood should be avoided, and if used as an alternative, all shelves and cabinet doors must be Formica on both sides; there should be no exposed wood, not even on the shelves inside the cabinets.

   a. Handwashing station countertops shall be made of porcelain, stainless steel, solid surface materials, or impervious plastic laminate assembly. For countertops that require a substrate, marine-grade plywood (or equivalent material) with an impervious seal shall be required.

   b. If a handwashing station includes casework, it should be designed to prevent storage beneath the sink.

   c. If using sink stations with double cabinets (upper and lower), the placement of the paper towel dispenser on the wall between the cabinets must be carefully considered. The dispenser's height must be considered not to touch the surfaces.

BASEMENT LEVEL

1. Janitor. A floor-mounted shower-type sink with its wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where

the mops are attached so that they drain in the sink area and not on the floor. Also, because the environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often this personnel is female and has less brute strength.

2. Food Nutrition Services. In addition to the requirements established in the FGI Guidelines for Design and Construction of Hospitals and the U.S. Public Health Service FDA Food Code, they must comply with all provisions of Hospital Regulation No. 9184 of July 1, 2020, Chapter XXII Nutrition and Dietetics Services, Articles 22.15 through 22.26.

    a. The nutrition and dietetics service will have restrooms exclusively for the use of its employees, both male and female. These restrooms will be in an area outside or separate from the kitchen. This area will be equipped with lockers and showers for staff hygiene.

    b. There must be a handwashing station for staff before entering the kitchen area.

    c. Please observe the entry and exit logistics in the tray washing area (dirty trays enter on one side and clean trays exit on the other).

    d. Determine the janitor that will be for the exclusive use of food and nutrition services.

    e. Determine the storage waste disposal area that will be for the exclusive use of food and nutrition services.

    f. Determine the elevator that will be for the exclusive use of food and nutrition services, as required by Hospital Regulation No. 9184 of July 1, 2020, Chapter XXII Nutrition and Dietetics Services, Articles 22.15 to 22.26, which states, "…To the extent possible and during food distribution hours, there will be an elevator exclusively for use in food distribution."

3. Bio-Security Storage. The storage room for contaminated biomedical waste must comply with all provisions of Hospital Regulation No. 9184 of July 1, 2020, Chapter XXV, Security Program and Physical Plant, Article 25.06, Other Security Measures, Section E, Storage for Biomedical Waste and Morgue.

a. Must have a closed cooling system or be separated from the rest of the hospital.

b. Must be properly labeled and access restricted to authorized personnel only.

c. Must have handwashing facilities outside the storage area.

d. Must have a supply of handwashing supplies and personal protective equipment.

FIRST LEVEL

1. Provide some type of control on the doors (mkd 1-143, 1-104 & 1-120) that give access to the intensive care department only for authorized personnel.

2. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

3. Rooms. Ensure that intensive care rooms meet the minimum space requirements required by the FGI Guidelines for Design and Construction of Hospitals for intensive care rooms.

    a. Area. Each intensive care patient room shall have a minimum clear floor area of 200 square feet (18.58 square meters) with a minimum headwall width of 13 feet (3.96 meters) per bed.

    b. Clearances. intensive care patient room shall have the minimum clearances:

        i. 1 foot (30.48 centimeters) from the head of the bed to the wall
        ii. 5 feet (1.52 meters) from the foot of the bed to the wall
        iii. 5 feet (1.52 meters) on the transfer side
        iv. 4 feet (1.22 meters) on the non-transfer side

4. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

5. Consider providing lockers for the intensive care department staff.

6. Consider a scrub station, as required by the FGI Guidelines for Design and Construction of Hospitals establish that at least one (1) hand scrub position shall be located adjacent to the entrance to each operating room, class 3 imaging room and cesarean delivery room.

    a. One (1) hand scrub station consisting of two scrub positions shall be permitted to serve two operating rooms if located adjacent to the entrance of each room.

7. Provide some type of control on the doors (mkd 1-037, 1-024, 1-021 and 1-013) that give access to the surgery department área-operating rooms only for authorized personnel.

8. Define biomedical waste room & waste room dedicated to a surgery department (operating rooms A, B, C, D & E). Consider the transit for environmental services personnel who will be dedicated to the operating rooms.

9. Ensure that the multiple-patient bays or cubicles in the pre- and post (recovery) procedure patient care station (spaces mkd 1-069, 1-010, 1-009 & 1-012) meet the minimum space requirements required by the FGI Guidelines for Design and Construction of Hospitals for pre- and post-procedure (recovery) patient care areas.

    a. Where bays are used, the following minimum clearances shall be provided:

        i. 5 feet between the sides of patient beds/gurneys/lounge chairs.
        ii. 3 feet between the sides of patient beds/gurneys/lounge chairs and adjacent walls or partitions.
        iii. 2 feet between the foot of patient beds/gurneys/lounge chairs and the cubicle curtain.

    b. Where cubicles are used, the following minimum clearances shall be provided:

        i. 3 feet between the sides of patient beds/gurneys/lounge chairs and adjacent walls or partitions.

ii. 2 feet between the foot of patient beds/gurneys/lounge chairs and the cubicle curtain.

10. Identify a Lounge area for staff in surgery department.

11. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

12. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

13. Identify the staff lounge area, staff toilet room & staff storage facilities designated for staff in trauma stabilization & observation area.

14. Provide some type of control on the doors (*mkd 1-059 & 1-101*) that give access to the trauma stabilization & observation area only for authorized personnel.

15. Consider the nourishment room in trauma observation area as required by FGI Guidelines for Design and Construction of Hospitals for observation unit in emergency services.

16. Define patient toilet room & shower room in trauma observation area as required by FGI Guidelines for Design and Construction of Hospitals for observation unit in emergency services. - At least one toilet room shall be provided for each six patient care station and for each major fraction thereof. A minimum of one shower room is provided in the observation rooms. Combination of the shower room and toilet room in the same room shall be permitted. See toilet room space mkd 1-094.

17. Consider the exam room in trauma observation area as required by FGI Guidelines for Design and Construction of Hospitals for observation unit in emergency services. - An exam room shall be provided in observation unit. Omission of the exam room shall be permitted if all patient care stations are single-patient's rooms.

18. Ensure that multiple-patient observation bays or cubicles in trauma observation areas (space mkd 1-068) at least meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for observation unit in emergency services.

    a. Patient bays or cubicles shall have a minimum clear floor area of 80 square feet per patient care station.

    b. A minimum clearance of 5 feet shall be provided between the sides of adjacent patient beds.

    c. A minimum clearance of 4 feet shall be provided between the sides of patient beds and adjacent walls or partitions.

19. Ensure that multiple-patient trauma rooms or cubicles in trauma stabilization area (spaces mkd 1-081, 1-086, 1-089 & 1-091) at least meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for trauma rooms in emergency services.

    a. Space requirements for a single-bed trauma/resuscitation room: Area. Each trauma/resuscitation room shall have a minimum clear floor area of 250 square feet. Clearances. A minimum clearance of 5 feet shall be provided around all sides of the gurney.

    b. Space requirements for a multiple-patient trauma/resuscitation room: Area. Where a trauma room for multiple patients is provided, the minimum clear floor area for each patient care station defined by privacy curtains (a bay) shall be 200 square feet. Clearances. A minimum clearance of 5 feet shall be provided around all sides of the gurney, with 10 feet between each patient's bed or gurney.

    c. Door openings. Doorways leading from the ambulance entrance to the trauma/resuscitation room shall have a minimum clear width of 72 inches (6 feet) and a height of 83.25 inches (7 feet).

20. Isolation room space mkd 1-084.

    a. A handwashing station is recommended in this room, in addition to the one in the anteroom.

b. The proposed first floor plan does not have all dimensions marked; the plan was only viewed digitally, without considering the scale. However, it must be ensured that the isolation room (AII room) in the trauma observation area meets at least the minimum space requirements established by the FGI Guidelines for Design and Construction of Hospitals for isolation rooms in emergency services. - They must have a minimum of 120 square feet. - A minimum clearance of 4 feet must be provided between the sides and feet of patient gurneys or beds and adjacent walls or partitions.

c. All isolation rooms (AII rooms) must be visible from a nurse station.

21. Decontamination triage. The human decontamination room must comply with all the requirements established in FGI Guidelines for Design and Construction of Hospitals for interior human decontamination room in emergency services regarding location, entrance, space requirements, architectural detail & surface requirements, electrical system requirements, plumbing system requirements & nurse call requirements.

22. Provide some type of control on the doors (mkd 1-179 & 1-162) that give access to the fast track area only for authorized personnel.

23. Ensure that exam or evaluation rooms (spaces mkd 1-205 & 1-207) meet with the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for exam room or emergency department treatment room in fast-track area in emergency services.

    a. Area. Shall have a minimum clear floor area of 100 square feet with a minimum clear dimension of 10 feet.

    b. Clearance. A minimum clearance of 3 feet on each side and at the foot of the exam table, recliner or chair.

24. Consider supply storage (medical supplies, medications, etc.) in a fast-track area, as required by FGI Guidelines for Design and Construction of Hospitals for fast-track areas in emergency services.

25. Define staff lounge area, staff toilet room & staff storage facilities designated for staff in fast-track area.

26. Ensure that from the triage area (vitals area-spaces mkd 1-200 & 1-201) the nursing staff has a full and unobstructed view of the patients in the waiting room.

END OF DOCUMENT

Attachment D: SARPS Recommendations

SECOND LEVEL

1. Ensure that all critical care rooms meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for critical care rooms

    a. Area. Each intensive care patient room shall have a minimum clear floor area of 200 square feet (18.58 square meters) with a minimum headwall width of 13 feet (3.96 meters) per bed.

    b. Clearances. intensive care patient room shall have the minimum clearances:

        i. 1 foot (30.48 centimeters) from the head of the bed to the wall
        ii. 5 feet (1.52 meters) from the foot of the bed to the wall
        iii. 5 feet (1.52 meters) on the transfer side
        iv. 4 feet (1.22 meters) on the non-transfer side

2. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

3. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

4. Consider some types of control on the doors (mkd 2-042, mkd 2-091, 2-022 & 2-021) that give access only for authorized personnel.

5. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

6. Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

Attachment D: SARPS Recommendations

THIRD LEVEL

1. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

   Define the janitor room for the exclusive use of the rehabilitation area.

2. Physical therapy gyn. It must have a staff handwashing station.

3. Ocupacional therapy. A handwashing station shall be provided in each room where therapy or teaching is conducted.

4. In individual therapy area (space mkd 3-093) each patient station shall permit an arrangement that provides a minimum clearance of 2 feet 8 inches on at least three sides of the therapy furniture (e.g., chairs recliners, tables, beds, or mats).

5. In occupational therapy (space mkd 3-065) each classroom room shall have 30 square feet per person plus and additional 30 square feet for the instructor and instructional resources. Each classroom shall have a minimum of 150 square feet.

6. Work areas and counters shall be suitable for wheelchairs access.

7. The therapy program should include speech and hearing service facilities.

8. Define the janitor room that will be for the exclusive use of the rehabilitation area.

9. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

10. Provide some type of control on the doors that give access to the unit only for authorized personnel.

Attachment D: SARPS Recommendations

FOURTH LEVEL

1. Ensure that all telemetry care rooms (spaces mkd 4-013, 4-016, 4-017, 4-020, 4-021, 4-025, 4-026, 4-029, 4-030, 4-032, 4-077, 4-080, 4-081, 4-084, 4-085, 4-089, 4-090, 4-093, 4-094 and 4-097) if the unit is to be considered as intermediate care at least meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for intermediate care rooms.

    a. Area. Each single-patient room should have a minimum clear floor area of 150 square feet.

    b. Clearances. A minimum clearance of 4 feet shall be provided between the sides of the bed to walls or fixed obstructions.

2. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

3. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

4. Consider some types of control on the doors (mkd 4-005 & mkd 4-085) that give access only for authorized personnel.

5. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

Attachment D: SARPS Recommendations

FIFTH LEVEL

1. Rooms. Ensure that intermediate care rooms and all rooms at least meet the minimum space requirements required by the FGI Guidelines for Design and Construction of Hospitals for intermediate care rooms, as applicable.

    a. Area. Each single-patient room should have a minimum clear floor area of 150 square feet.

    b. Clearances. A minimum clearance of 4 feet shall be provided between the sides of the bed to walls or fixed obstructions.

2. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

3. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

4. Consider some types of control on the doors (mkd 5-005 & mkd 5-085) that give access only for authorized personnel.

5. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

Attachment D: SARPS Recommendations

SIXTH LEVEL

1. Rooms. Ensure that intermediate care rooms and all rooms at least meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for intermediate care rooms, as applicable.

    a. Area. Each single-patient room should have a minimum clear floor area of 150 square feet.

    b. Clearances. A minimum clearance of 4 feet shall be provided between the sides of the bed to walls or fixed obstructions.

2. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

3. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

4. Consider some types of control on the doors (mkd 6-005 & mkd 6-085) that give access only for authorized personnel.

5. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

Attachment D: SARPS Recommendations

SEVENTH LEVEL

1. Rooms. Ensure that intermediate care rooms and all rooms at least meet the minimum space requirements required by FGI Guidelines for Design and Construction of Hospitals for intermediate care rooms, as applicable.

    a. Area. Each single-patient room should have a minimum clear floor area of 150 square feet.

    b. Clearances. A minimum clearance of 4 feet shall be provided between the sides of the bed to walls or fixed obstructions.

2. Equipment Storage Room. Define this space because the equipment used in the unit cannot obstruct corridors or other spaces, nor be stored next to clean and sterile supplies; there is always medical equipment in a unit that needs to be stored or that has spare parts.

3. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

4. Consider some types of control on the doors (mkd 7-005 & mkd 7-071) that give access only for authorized personnel.

5. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

Attachment D: SARPS Recommendations

EIGHT LEVEL

1. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

2. Elevators 1, 2, 3 and 4 must be controlled only for authorized personnel.

3. Consider some types of control on the doors that give access only for authorized personnel.

Attachment D: SARPS Recommendations

NINTH LEVEL

1. Janitor. A floor-mounted shower-type sink with its low wall is preferred over the traditional wall-mounted sink for better functionality when placing the rack where the mops are attached so that they drain in the sink area and not on the floor. Furthermore, because environmental services personnel must exert a lot of force to carry the bucket and empty the water if the sink is wall-mounted, and often these personnel are female and have less brute strength.

2. Elevators must be controlled only for authorized personnel.

3. Consider some types of control on the doors that give access only for authorized personnel.

Attachment E: Owner's Requirements

The Designer will consider the following requirements for the continuity of the design:

Purpose: To ensure the continuous provision of advanced medical care for patients with major trauma, through the integration of diagnostic, therapeutic, surgical, critical support, and rehabilitation capabilities that allow for rapid stabilization, timely intervention, and optimization of functional and survival outcomes.

Clinical Mission: To operate as a Level I Trauma Center with 24/7 availability of specialized multidisciplinary teams, operating rooms prepared for emergency interventions, advanced imaging services (including CT, MRI, ultrasound, and interventional radiology), and intensive care units equipped for advanced life support. To ensure adherence to evidence-based protocols, maintain competencies through continuing education, promote trauma research, and coordinate the inter-institutional response for the comprehensive management of critical injuries in the population. To operate as a Level 1 Program validated by state and national standards.

Program Type: The program operating at this facility is defined as:

- Level 1 Comprehensive Trauma Program of the Puerto Rico and National Trauma System, recognized as the institution with the highest intervention capacity within the system. Maintaining the quality standards of both state and national accrediting agencies.
- Academic and Clinical Training Program.
- Coordination with the Medical Sciences Campus and other residency programs.
- Staff development program for the ASEM nursing division.
- Trauma Research, Education, and Prevention Program, responsible for continuing education initiatives, participation in clinical research, and injury prevention projects.
- Emergency and Disaster Preparedness and Response Program, given its essential role in mass casualty events and island-wide emergencies.

Their duties include:

- Communication with prehospital services and coordination of interhospital transfers.

- Triage, stabilization, and definitive treatment for complex trauma.
- Trauma registry for analysis and continuous improvement.
- Compliance with state regulations and federal regulations and accreditations.

Key Departments

Emergency Room - Essential in a Level I Trauma Center because it allows for the immediate assessment of critically ill patients, activation of the 24/7 trauma team, initial stabilization with emergency interventions, and rapid access to advanced diagnostics and operating rooms. Furthermore, it coordinates patient flow from EMS arrival to transfer to surgery, ICU, or interventional radiology, ensuring optimal response times and adherence to clinical standards.

Operating Room - Essential in trauma because they allow for immediate intervention in life-threatening injuries, such as uncontrolled bleeding, penetrating abdominal or thoracic trauma, and critical vascular injuries. Their 24/7 availability ensures rapid access to emergency surgery, minimizes delays in damage control, and meets established response standards for Level I Trauma Centers.

Imaging Center - An imaging center is essential in trauma because it allows for rapid and accurate diagnoses through studies such as CT scans, X-rays, FAST ultrasound, and, when required, MRI (existing area) or interventional radiology. Its 24/7 availability expedites the identification of internal bleeding, thoracic, abdominal, pelvic, and neurological injuries, guiding critical management decisions, reducing delays in transfer to surgery, and meeting the operational standards of Level I Trauma Centers.

Laboratory - A laboratory is essential in trauma care because it allows for the immediate acquisition of critical results, such as arterial blood gases, hemoglobin and hematocrit, coagulation studies, lactate (blood type and type), electrolytes, and metabolic markers. Its 24/7 availability expedites decisions regarding resuscitation, massive transfusions, hemorrhage control, and surgical management. The laboratory ensures turnaround times compatible with the standards of a Level I Trauma Center and optimizes the stabilization and prognosis of critically ill patients. The design will consider the integration of the new building with the existing Laboratory.

Blood Bank - A blood bank is essential in trauma because it allows for the immediate availability of critical blood products, including packed red blood cells, plasma, platelets, and products for massive transfusion protocols. Its 24/7 operation ensures response times compatible with the management of exsanguinating hemorrhage, hemostatic resuscitation, and damage control surgeries. Furthermore, it ensures blood typing, compatibility, and safe storage, preventing delays that could compromise patient survival. This is a fundamental requirement for meeting the clinical standards of a Level I Trauma Center. The design will consider the integration of the new building with the existing blood bank area.

Pharmacy - A pharmacy is essential in trauma because it ensures the immediate availability of critical medications 24/7, including agents for resuscitation, sedation, analgesics, hemodynamic management, anticoagulation, and broad-spectrum antibiotics. Its presence allows for rapid, accurate, and safe dispensing, reduces medication errors, and ensures that emergency, massive transfusion, and perioperative management protocols are followed without delay. This is fundamental for the stability of critically ill patients and for meeting the operational standards of a Level I Trauma Center. The design will consider the integration of the new building with the existing Pharmacy.

Helipad - A helipad is essential in a Trauma Center because it allows for the rapid and safe air transport of critically injured patients from remote scenes or institutions that lack advanced trauma capabilities. Its 24/7 availability significantly reduces transport times, facilitates immediate access to highly complex surgical and diagnostic services, and meets the operational standards of a Level I Trauma Center. This optimizes survival rates for time-dependent injuries and strengthens the response to regional emergencies or mass casualty incidents.

Note: To comply with FAA requirements for landing helicopters such as the EC135, EC145, AS350, UH-72, and MH-60, the rotor diameter of the largest helicopter must be taken into consideration. The platform should measure 100 x 100 ft and support a weight of at least 25 tons. Other safety features include perimeter lighting, windsock lighting, markings on the platform, adequate drainage, and a suppression system with a push-button activation near the building entrance.

Functional and Efficient Facility

A Level I Trauma Hospital must have the infrastructure, personnel, clinical services, and operating systems necessary to provide immediate, continuous, and highly specialized

care for patients with critical injuries. To be functional and efficient, it must meet the following requirements.

1. Essential Clinical Services (24/7)

    • Fully equipped emergency room with specialized resuscitation areas.

    • Trauma surgeon on-site or immediately available.

    • Complete surgical team available always.

    • Neurosurgery, orthopedics, and vascular surgery are available immediately.

    • 24/7 diagnostic services: CT, FAST ultrasound, X-ray.

    • Blood bank with mass transfusion capacity. (existing area of blood bank)

    • Continuous clinical laboratory with rapid results. (existing area of laboratory)

    • Operational Intensive Care Units with trauma-trained staff.

    • Complementary services: early rehabilitation, mental health, and social support.

2. Functional Infrastructure

    • Physical proximity between the emergency department, CT scanner, operating rooms, and ICU.

    • Direct and exclusive access for ambulances.

    • Operating rooms always available for trauma emergencies.

    • Fast and unobstructed circulation routes.

    • Adequate spaces to manage multiple critically ill patients simultaneously.

3. Trained and Available Personnel

- Trauma Director and Trauma Coordinator

- Clinical staff with ongoing trauma training (ATLS, ATCM, PHTLS, Initial Trauma Management Course, AHA Course, etc.)

- Sufficient staff to manage more than one critical case simultaneously

- Interdisciplinary teams for comprehensive care

4. Operational and Administrative Systems

   - Formal system for activating the Trauma Team.

   - Written protocols for trauma management, massive transfusion, and disaster response.

   - Active Trauma Committee and regular quality reviews.

   - Up-to-date Trauma Registry for analysis and continuous improvement.

   - Integrated communication with EMS, ambulances, and air transport.

   - Operational support services: 24/7 pharmacy, sterilization, biomedical engineering

5. Capacity and Performance

   - Adequate volume and severity of trauma patients to maintain competence and accreditation.

   - Capacity to receive and manage multiple victims simultaneously.

   - Sufficient ICU beds for critical trauma.

   - Operating rooms and equipment always available or prioritized for trauma

6. Academic and Community Role

   - Participation in clinical education and training programs.

- Trauma research activities.

- Injury prevention and community education programs

Size, capacity and ratio

The general rule is that each function of the program must have physical space that allows it to be executed with speed, accessibility, and efficiency.

1. Minimum Size (Physical Infrastructure) The hospital must have sufficient space to ensure rapid flow, simultaneous care, and immediate access to critical services. The following minimum functional areas are required:
   - Resuscitation rooms equipped for acute trauma intervention (minimum 4-8).

   - Operating rooms dedicated to acute trauma surgery (minimum 2; preferably 5).

   - Imaging area with immediate access from the emergency department (adjacent CT scan).

   - ICU with an adequate number of beds (see capacity below).

   - Integrated clinical and logistical support areas (existing area: laboratory, blood bank, sterilization, among others). The final size is determined by projected capacity, but it can never be less than sufficient to provide an immediate response to multiple critical cases simultaneously.

2. Minimum Capacity is defined by patient volume and available beds, ensuring the hospital can continuously manage complex cases. Common minimum requirements for Level I:

   - High volume of trauma patients per year.

   - 20–30 dedicated or available ICU beds for trauma.

   - 2–5 operating rooms available always.

   - Capacity to receive multiple victims simultaneously.

• Sufficient clinical and surgical staff to manage more than one critical case at a time

3. Relationship between Design and Program The physical design of the hospital must reflect and support the functions required by the clinical program. This means:

• Interventional flow: Emergency Department → CT → Operating Rooms → PACU → ICU must be connected without barriers or long distances.

• Rapid flow: Wide corridors, direct routes for stretchers, and separate access for ambulances.

• Capacity for expansion and the flow of multiple patients.

• Spatial distribution that prioritizes visibility, supervision, and rapid response.

• Design that allows for the execution of Trauma team protocols without delays.

• Strategic placement of the blood bank, laboratory, and pharmacy to minimize turnaround time. (existing areas)

• Spaces prepared for disasters or mass casualty events

Minimum functional requirements of the program

1. Availability of Specialists and Services (24/7)

• Trauma surgeon are always available at the hospital.

• General surgery staff with trauma experience.

• Neurosurgery, orthopedics, vascular surgery, plastic surgery, anesthesiology, intensive care, and other critical specialties always available.

• Clinical subspecialists available as needed (cardiology, gastroenterology, etc.)

2. Emergency Room and Operating Rooms

    • Fully equipped resuscitation area.

    • Operating rooms available and prepared for emergencies at all times.

    • Capacity to perform complex surgeries immediately

3. Diagnostic Services (24/7)

    • CT scan available immediately.

    • Ultrasound for FAST testing.

    • Fully functional blood bank (including mass transfusion, existing area).

    • Continuous clinical laboratory with rapid turnaround times. (existing area of laboratory)

    • X-ray available immediately

4. Critical Care Units

    • 24/7 operational adult ICU with qualified staff.

    • Staff trained in critical trauma.

5. Trauma Team Activation System

    • Coordination with EMS, paramedics, and helicopters.

    • Formal trauma activation protocol with defined criteria.

    • Immediate team response (leading surgeon arrives quickly).

6. Academic and Training Requirements

- Formal continuing education program for physicians, nurses, and technicians.

- Participation in resident training (if applicable).

- Certified training in ATLS, ATCM, PHTLS, Initial Trauma Management Course, AHA Course, etc.

- Active role in teaching, research, and prevention activities

7. Administration and Quality

   - Hospital Administrator

   - Medical Director of Trauma (experienced surgeon)

   - Administrative Manager

   - Clinical Manager

   - Head Nurse

   - Trauma Committee with monthly meetings

   - Quality System (PIPS)

   - Trauma Registry and TQIP

8. Capacity to Handle High Volumes

   - High annual volume of trauma patients, including critical cases

   - Capacity to receive transfers and coordinate trauma networks

9. Rehabilitation and Support Services

   - Physical, occupational, and post-trauma rehabilitation services

   - Mental health, stress management, and social support services for patients and families

10. Community Involvement and Prevention

    - Active injury prevention programs.
    - Collaboration with safety agencies, schools, and community organizations

Clinical Services and Operational Model

1. Minimum Clinical Services

    - 24/7 Emergency Department with resuscitation rooms.
    - Trauma surgeon on-site or immediately available 24/7.
    - Full surgical team available 24/7.
    - Neurosurgery, orthopedics, and vascular surgery are always available.
    - CT scan, FAST ultrasound, and conventional radiology.
    - 24/7 blood bank with mass transfusion capacity. (existing area)
    - 24/7 clinical laboratory. (existing area)
    - 24/7 Operational Intensive Care Units.
    - 24/7 intermediate care units.
    - Early rehabilitation services.
    - Mental health and psychosocial support.
    - Clinical social work services

2. Minimum Operational Services

    - Formal Trauma Team activation system.

- Trauma Director and Coordinator.
- Active Trauma Committee.
- Trauma Registry. • Quality Program
- Written protocols for trauma management and massive transfusion.
- Quality system with case reviews.
- Ongoing staff training.
- Direct communication with EMS and ambulances.
- Capacity to manage multiple victims simultaneously.
- 24/7 support services: pharmacy, sterilization, biomedical maintenance

Room and Department Requirements:

1. Minimum Rooms Required

- Resuscitation rooms (minimum 4-8).
- Additional emergency cubicles for non-critical patients (2-4).
- At least 2 operating rooms available for trauma always (preferably 5).
- Post-anesthesia care unit (PACU) nearby.
- ICU beds (minimum 30 dedicated to or available for critical trauma).
- General trauma inpatient beds (minimum 90).
- Computed tomography (CT) room accessible from the emergency department.
- X-ray and ultrasound room.

- Isolation rooms for critical patients (minimum 4).

- Mass transfusion room with capacity to provide universal blood, mass transfusion, and immediate access to a blood bank (existing area).

- Trauma team meeting room.

- Support services rooms: physicians, nursing, pharmacy, rehabilitation, and clinical break room

2. Minimum Required Departments – It should be noted that many of these services do not need to be located within the hospital but must be nearby and accessible.

    - Emergency Department, fully equipped and operational 24/7.

    - Surgery Department (with operating room and equipment available).

    - Intensive Care Unit.

    - Imaging Department: CT, X-ray, ultrasound.

    - Clinical Laboratory (existing area) and Pathology, 24/7.

    - Blood Bank with mass transfusion capacity. (existing area)

    - Anesthesia Department, available 24/7.

    - Orthopedics Department, available 24/7.

    - Neurosurgery Department, available 24/7.

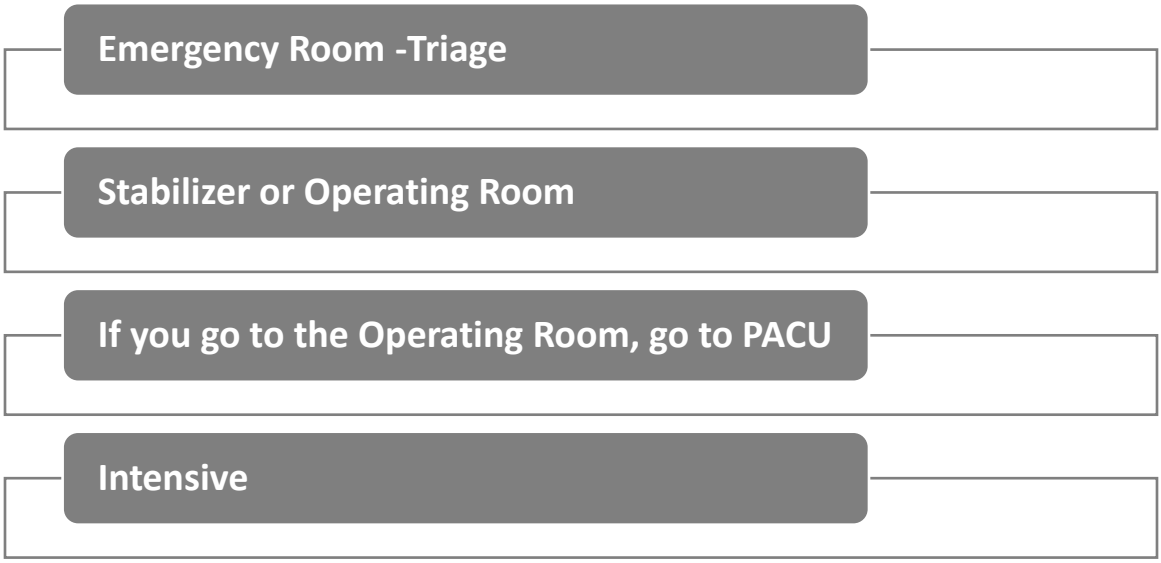
    - Vascular Surgery Department, available 24/7.

    - Rehabilitation Services (physical and occupational).

    - Mental Health and Social Work Services.

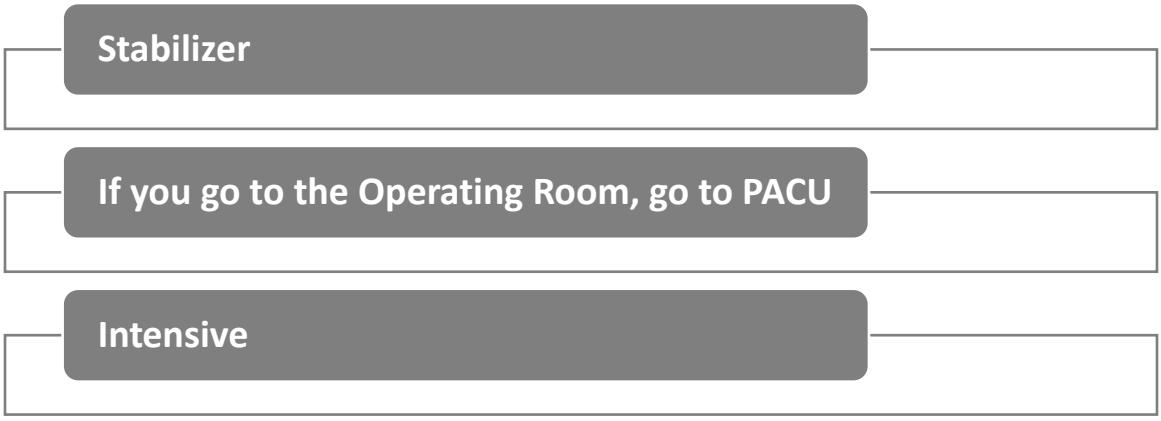
    - Pharmacy Department, operational 24/7.

- Continuous sterilization.
- Biomedical Engineering and Maintenance.
- Engineering and Physical Plant Services
- Supply and Warehousing Services
- Sterile Supply Services
- Kitchen and Food Distribution Services
- Laundry Services
- 24/7 Security Services



3. Minimum Functional Services and Spaces
   - Exclusive access for ground ambulances and areas
   - Triage areas
   - Stabilization area
   - Trauma areas for multiple victims
   - Rapid routes between Emergency Department → CT → Operating Rooms → PACU → ICU
   - Critical equipment preparation area
   - Trauma supply storage
4. Essential Administrative Elements
   - Hospital Administrator
   - Medical Director of Trauma (experienced surgeon)

- Administrative Manager
- Clinical Manager
- Head Nurse
- Trauma Committee with monthly meetings
- Quality System (PIPS)
- Trauma Registry and TQIP
- Trauma Committee Room
- Education and Training Areas



- Infection Control and Quality Service
- Care Environment and Emergency Management Service

Operational Flow

1. Ground ambulance flow

2. Area ambulance flow

Cleaning and disposal service for regulated (contaminated) biomedical waste and domestic (regular) waste

1. Cleaning and Disinfection Currently, this service is provided by a private company, and the contract is managed by the Maintenance Services Manager, who is an ASEM employee. In summary, the services required are:

   a. Cleaning and disinfection of clinical and administrative areas.

      • Application of disinfectants approved by the hospital and regulatory agencies.

      • Supply dispensers and replenish and dispense toilet paper, hand towels, and soap.

   b. Cleaning of patient rooms

      • Daily cleaning and disinfection of floors, surfaces, and bathrooms.

      • Terminal cleaning upon patient discharge or transfer.

   c. Infection control and health and safety

      • Compliance with cleaning protocols according to risk level (high, moderate, low).

      • Proper use of personal protective equipment (PPE).

      • Collaboration with the Office of Institutional Security and Infection Control.

   d. Cleaning of common areas

      • Hallways, lobbies, elevators, stairwells, and public restrooms.

      • Maintain a clean and presentable environment for visitors.

   e. Terminal or specialized cleaning

      • Control and removal of spills involving biological fluids according to established protocol.

• Cleaning and disinfection of areas with isolation (contact, droplet, or airborne).

• Enhanced processes during outbreaks or health emergencies. 6. Coordination and Reporting

• Coordination of shift work assignments and task supervision.

• Completion of required control sheets.

• Participation in internal cleaning audits.

f. Maintains, cleans, and tidies external common areas and green spaces.

Handling and Disposal of Regulated Biomedical Waste and Household Waste

This service is provided by a private company to private companies, and the contract is managed by the Maintenance Services Manager, who is an ASEM employee. In summary, the services required are:

1. Contaminated Waste or Regulated Biomedical Waste (contracted services) Services include:

   • Providing and disposing of red sharps containers.

   • Providing a red container for the storage and disposal of contaminated waste.

   • Secure off-site transportation.

   • Documentation and chain of custody (manifests according to regulations (EPA, OSHA, and Department of Health)).

2. Household Waste (Non-Hazardous Waste or regular trash) Services include:

   • Providing and distributing black bags for collection.

   • Collection, transportation, and disposal of trash in containers.

   • Daily collection in off-site green containers

Environmental Limitations

The utility system must operate in optimal condition, and for this, a preventive maintenance plan must be implemented. In addition, a series of tests required for environmental compliance must be included, such as:

- Electrical generators - % sulfur content
- Oxygen and medical gases - oxygen purity tests at the dispatch point and tests every two years on all valve panels and medical gas alarms in the building
- Diesel tanks - annual tank testing to measure composition and quality, and tank cleaning
- Potable water systems - monthly purity tests and annual tests for microorganisms and cistern cleaning
- HVAC - Annual tests must be performed on these areas to ensure compliance with negative and positive pressures, temperature, humidity, and air changes
- Maintenance, testing and certification of security systems: access controls, nurse call systems, security cameras, panic buttons and alarm systems, fire detection and suppression

Other Environmental Compliance Requirements

- Large storage areas for utensils, hazardous materials, and bins, as per regulations. A floor-mounted sink must be provided for easy disposal and washing.
- Strategically located handwashing stations and hygiene stations.
- Washable and antimicrobial materials and finishes.
- Access Restrictions to Areas
- Controlled access to operating rooms, ICU, laboratory (existing area), radiology, and other areas.
- Separate circulation routes for patients, staff, and materials.

- Noise, Vibration, and Lighting

- Operating rooms and imaging areas must be free of vibrations that could affect equipment (CT).

- Noise control in the ICU to avoid impacting patients.

- Adequate and redundant lighting for surgical emergencies

Location and surroundings

- Quick and safe access for ambulances.

- Protection from traffic, obstructions, and external hazards

Hazardous Waste and Materials Management

- Proper storage of biomedical waste, separate from household waste.

- Control of chemicals from laboratories, radiology, sterilization areas, pathology, and other areas.

- Safe waste disposal routes that do not cross clinical areas

Operational Limitations and Site Restrictions Compliance with Regulatory and Accrediting Agencies

1. Access Control

   - Limited access to critical areas such as trauma rooms, laboratory (existing area), pathology, operating rooms, intensive care unit, radiology, pharmacy, among others.

   - Access control to computer rooms, electrical rooms, and mechanical rooms.

   - Mandatory staff identification with ID cards.

   - Restricted visitor access during specific hours and in specific areas.

- Metal detectors
- Limitations on the number of companions and visitors.

2. Infection Control
   - Restricted access to contaminated waste areas.
   - Separate areas for contaminated waste and household waste.
   - Cleaning closets are large enough to store the required utensils.
   - Surveillance monitoring of temperature and humidity, negative pressure rooms, positive pressure rooms, and air exchange.
3. Handling of Medications and Medical-Surgical Supplies
   - Closed and controlled pharmacy areas.
   - Access restricted to authorized clinical personnel.
   - Electronic dispensing systems with access control (PYXIS) for medications and medical-surgical supplies.
4. Morgue and Laboratory Area (existing areas)
5. Physical Plant and Life Safety
   - Compliance with fire and smoke barriers such as doors, windows, and walls.
   - Compliance with all fire alarm, detection, and suppression systems.
   - Restrictions on the use of freight and patient elevators.
   - Safe evacuation ramps and stairs
6. Quality Services Program – Patient Safety

7. Occupational Health and Safety

8. Radiation Safety.

Areas Adjacent to the Site

1. Nearby places to buy food or food and water dispensers

2. Accessible OPD pharmacies near the hospital

3. Nearby places to buy clothing, medical devices, or essential items such as blankets, urinals, sandals, soap, toothpaste, sanitary napkins, and others

4. Accessible areas for public transportation

5. Accessible areas with ATMs for cash withdrawals

6. Parking for employees, patients, and visitors

7. Construction areas near the site

Life Safety Diagrams

To comply with life safety codes and regulatory and accrediting agencies, we must have life safety plans for the building that demonstrate and comply with the International Fire Code, NFPA 101 (Life Safety Code), adopted by the Puerto Rico Fire Department. These plans must include the fire resistance of fire barriers, smoke barriers, compartments, evacuation distances, sprinklers, hazardous areas, and other relevant information.

1. Fire and smoke barriers stop the spread of a fire or toxic smoke and help us make quick decisions in critical situations.

2. During inspections (Joint Commission, OSHA, fire department, etc.), these plans are required to demonstrate:

   • That the building is properly segmented.

   • That all penetrations are sealed.

- That the hospital meets life safety standards.

3. When contractors drill through walls or install cables, it is necessary to know:
   - If that wall is a fire or smoke barrier.
   - What type of sealant should be applied.
   - What materials are permitted by regulations.
   - Without plans, there is a risk of breaching a barrier and compromising safety.
4. These plans are consulted when creating evacuation plans, as they help define safe evacuation areas.
5. During inspections, they are used to identify and correct penetrations or damage to barriers and hazardous areas where there may be a risk of smoke or fire leakage, or doors and windows that do not meet the barrier's strength requirements.

Concepts of emergency exits or egress

Emergency exits (also called egress routes) are access points designed to allow the rapid, safe, and continuous evacuation of people from a facility during an emergency. They are regulated by standards such as NFPA 101 (Life Safety Code) and the International Fire Code, which is adopted by the Puerto Rico Fire Department.

Their primary function is to provide an unobstructed evacuation route, with a safe distance as applicable to the hospital area and protected until the exit point is outside the building.

Emergency exits must comply with the following:

- Clearly identified and marked routes.
- Continuous emergency lighting.
- Exit doors that open in the direction of evacuation.

- Corridors and passageways free of obstructions.
- Direct access to an external assembly point or safe area.
- Compliance with appropriate width, capacity, and construction requirements.

An emergency exit may include:

- Designated exit doors
- Protected passageways
- Internal or external staircases
- Ramps

Automatic Sprinkler System

Automatic fire sprinklers are a protective system that automatically discharges water when it detects high temperatures generated by a fire. Their use and maintenance are primarily regulated by the standards of NFPA 13, NFPA 25, and the International Fire Code, adopted by the Puerto Rico Fire Department.

Automatic sprinklers have three main functions:

- Each sprinkler has a temperature-sensitive element that activates when a specific temperature is reached.
- To control or extinguish the fire to prevent its spread with the help of fire or smoke barriers.

The sprinkler heads discharge water onto the area where the fire is located, reducing its spread and damage. For a sprinkler system to be compliant (according to NFPA 13 and 25), it must meet the following requirements:

- Annual inspection and testing of the sprinkler system and valves
- Pressure testing underload on its pump system

- Functional testing to ensure that the main valve, alarms, and pressure are working correctly.

- Documented maintenance (cleaning, lubrication, parts replacement).

- Up-to-date labeling and records.

- Installation of spray nozzles, as required by code. In areas with equipment that could obstruct the equipment, these nozzles must be strategically positioned; this includes fixed x-ray machines, CT scanners, and operating rooms.

- Unobstructed access to main and control valves, among others

Resilience requirements

The Trauma Hospital must maintain a high level of resilience to ensure the continuity of essential services in the event of any emergency that affects its operations. Institutional resilience encompasses mitigation, preparedness, response, and rapid recovery from natural, technological, or man-made disasters.

Key requirements include 24/7 operational continuity with redundant power, water, fuel, oxygen, communications, and IT systems to support vital clinical services. The hospital must fully comply with life safety standards, including functional sprinkler systems, alarms, clear egress routes, and regular inspections as required by regulatory and accrediting agencies.

A robust Hospital Incident Command System, updated emergency and mass casualty event management plans, adequate inventories of critical supplies, medical equipment, food, potable water, and direct coordination with state and federal agencies and other hospitals are also required.

Resilience also includes cybersecurity and ongoing training programs for all staff. These components ensure that the Trauma Hospital can maintain operations, protect the lives of patients and employees, and quickly restore services even in high-impact scenarios.

Emergency Surge Preparedness

The hospital maintains a comprehensive emergency surge preparedness strategy to ensure the continuity and stability of essential services in the event of a sudden increase

in demand for care during major emergencies or disasters. This preparedness allows for a rapid, coordinated, and effective response to incidents such as natural, technological, or man-made disasters that result in mass casualties, infrastructure failures, or other critical situations.

The institution has a Hospital Incident Command System (HICS) for emergency management and decision-making, updated plans, and the capacity to increase beds, staff, and clinical resources as needed. Adequate inventories of critical supplies, equipment, food, and medications are maintained for seven days, and infrastructure is prepared to operate sustainably for extended periods.

Preparedness includes active coordination with internal and external agencies, including Emergency Management, Emergency Medical Services, providers, and network hospitals. All staff receive ongoing training and participate in tabletop exercises, operational drills, and regular simulations to strengthen skills and validate established plans.

These efforts enable the hospital to preserve the safety of patients and employees, maintain critical services operating without interruption, and respond effectively to emergencies of any scale.

In addition, ASEM has two mobile units which, in an emergency or disaster situation, supplement the Trauma Hospital by expanding medical care if necessary. These units are transported from their storage location to a fixed location in the plaza in front of the hospital. However, they do not have negative pressure for handling highly infectious disease events.

Strengthening security

Strengthening security and surveillance in a hospital requires a comprehensive strategy that combines clear policies, modern technology, and effective operational practices. To ensure the protection of patients, visitors, and staff, it is essential to implement access control systems, camera monitoring in critical areas, and robust incident response protocols. Ongoing security personnel training, risk identification, and effective communication contribute to an organizational culture focused on prevention. Likewise, regular audits, adverse event analysis, and collaboration with external agencies help maintain a safe and resilient environment. With these practices, the hospital can ensure reliable, efficient healthcare services that meet quality and safety standards.

Life Safety Plan - ASEM requires the Contractor to assist in integrating the new building into its Life Safety Plan. The provision of medical services by the Puerto Rico Medical Services Administration (ASEM) requires that the use and handling of medical and construction equipment, machinery, and hazardous materials that could result in physical harm to people using these facilities, to property, or to the environment be carried out with care and knowledge.

Several factors can contribute to the start of a fire: electrical faults (splices, equipment maintenance, electrical connections, etc.), hot surfaces (stoves, ovens), spontaneous combustion (cloths contaminated with grease and/or oil), gases (propane, oxygen, acetylene), surgical procedures, lighting, and others.

To ensure the protection of human life, property, and the environment, the established Life Safety Plan provides information on the facility, fire suppression, detection, and alarm systems, procedures for controlling small and large-scale fires, partial or total evacuation procedures, and assistance and coordination with government response and support agencies, among other things.

The main objectives are:

- To always comply with the requirements of accrediting and regulatory agencies.
- To implement preventive measures and continuously monitor them to help minimize risks that could cause harm to human life, property, and/or the environment.
- To provide annual training and guidance to employees, or as needed, so they can manage and respond to unexpected and/or foreseeable events, carry out a proper evacuation, and know how to use the different types of portable fire extinguishing equipment.
- To provide information on the different fire alarm, detection, and suppression systems through system descriptions, inventories, and written procedures and/or guides, and to review them annually or as needed.

This Plan includes the following appendices:

- Appendix A: Hydrant Location Map

- Appendix B: Facility Evacuation Diagrams
- Appendix C: Fire and Smoke Barriers
- Appendix D: Fire Lane Location Map
- Appendix E: Flow System Location Map
- Appendix F: Preventive Maintenance Plan for Systems
- Appendix G: Alarm Panels
- Appendix H: Activation Identification Guide for Alarm Systems
- Appendix I: Guide for Real Small/Large Fire Alarms and False Alarms
- Appendix J: Evacuation Plan and Designation of Alternate Locations
- Appendix K: Fire Drill Evaluation Sheet
- Appendix L: Fire Prevention Standard
- Appendix M: Fire Prevention Measures in the Operations Room
- Appendix N: Classes of Fire Extinguishers
- Appendix O: Emergency Notification System
- Appendix P: Emergency Codes
- Appendix Q: Fire Classes
- Appendix R: Elevator Safety in Case of Fire
- Annex S: Evacuation for Persons with Disabilities
- Annex T: Operational Standard for Drills and Evacuations
- Annex U: Diagram of Alarm System Devices

- Annex V: Firefighting Procedures and How to Use a Fire Extinguisher
- Annex W: Fire Pump and Riser System of the Main Building

Life Safety Plan - ASEM requires the Contractor to assist in integrating the new building into its Safety Management Plan.

The Safety Management Plan is based on the recognition and responsibility of the Puerto Rico Medical Services Administration (ASEM) to provide and guarantee the safety and health of its patients, visitors, and employees.

It guarantees safe and healthy working conditions and physical facilities free from recognized hazards that cause or may cause illness, physical injury, or death to employees through daily visual inspections, documented general inspections: clinical areas every six (6) months, non-clinical areas annually, and emergency inspections.

Promote, provide, and supervise the use of safe and appropriate personal protective equipment (PPE) for all employees who require it on each work shift. Establish safe work methods and practices for all employees and contractors on each work shift. Train and guide employees and contractors on the use of safety equipment, PPE, and safety standards on each work shift.

Create, direct, support, and ensure the continuity of the various committees within the Administration, according to their annual work schedules.

Comply with all regulations, laws, rules, and standards always adopted by regulatory and accrediting agencies.

This Plan includes the following appendices:

- Appendix A: Health and Safety Committee Regulations
- Appendix B: Institutional Safety Inspection Checklist
- Appendix C: Physical Security and Access Control Standard
- Appendix D: Risk Notification Standard

Attachment E: Owner's Requirements

- Appendix E: Occupational Accident and Incident Notification
- Appendix F: Patient and Visitor Accident and Incident Notification
- Appendix G: Facility Maintenance and Security
- Appendix H: General Summary of Health and Safety Standards
- Appendix I: General Summary of Health and Safety Standards for Patients and Visitors
- Appendix J: No Smoking Regulations
- Appendix K: Vector and Pest Control Program
- Appendix L: Field Medicine
- Appendix M: Health and Safety Program
- Appendix N: Ergonomics Program
- Appendix O: Noise Conservation Program
- Appendix P: Institutional Program for the Use of Personal Protective Equipment
- Appendix Q: Institutional Standard for the Use of Eyewash Equipment
- Appendix R: Institutional Safety Respiratory Protection Program
- Appendix S: Personal Protective Equipment Protocol for Portable C-Arms
- Appendix T: Protocol for the Use of Personal Dosimeters (Film Badge)
- Appendix U: Institutional Security Service Sheet
- Appendix V: Access Permit Form for Entry to Areas Protected by Electronic Access Control

- Appendix W: Authorization Form to Receive, Possess, and Use the Electronic System Card

Trauma Logistics and Life Safety Systems

Trauma Logistics

• Must ensure a rapid and coordinated response to emergencies.

• This includes the strategic placement of emergency vehicles and equipment to provide advanced patient care and first aid to visitors in accessible areas.

• All personnel must be trained in basic and advanced cardiopulmonary resuscitation (CPR).

• Rapid routes must be established to allow emergency teams to reach the affected area without obstruction.

• Maintain an up-to-date plan for internal and external communication with emergency services.

• Conduct regular drills to ensure personnel know how to act and where to find resources, including functional exercises.

• Develop and maintain a continuing education program

Life Safety Systems

• Integrate active and passive measures to protect occupants during an emergency.

• This includes:

- Fire detection and alarm system.
- Automatic sprinklers.
- Emergency lighting.
- Smoke control and pressurization systems where applicable.

- Clearly marked and unobstructed evacuation routes.
- Compartmentalization using fire-resistant walls and doors.
- Full-to-ceiling walls in hazardous rooms.
- Fire-resistant doors, windows, fittings, and glass.
- Portable fire extinguishing system (fire extinguishers).
- Safe evacuation ramps and stairways.
- Stairwell pressurization systems.

- Their design must aim to create sufficient time for evacuation, reduce the spread of smoke and fire, and allow for fire department intervention.

Attachment E: Owner's Requirements

Information Technology Department data

DESCRIPTION	INFORMATION STORAGE LOCATION	MAINTENANCE FREQUENCY	CURRENT METHOD OF PROTECTION	RECOMMENDATIONS FOR ADDITIONAL PROTECTION METHODS (if necessary)	PROVIDER
Meditech System	Local hosting in Puerto Rico (Neptuno) under an infrastructure and hosting services agreement with CloudWave. The service includes the rental of the technological infrastructure and services necessary for the operation of MEDITECH's applications.	Daily	Redundant infrastructure with high availability and disaster recovery mechanisms. Backup via BridgeHead Backup.	Maintain current hosting, support, and backup contract. Perform regular disaster recovery tests.	Cloudwave
Computers, communication equipment and peripherals	Servers managed by the ASEMNet infrastructure	Daily and others as needed or upon request	Backup via Veeam for servers, Dorado for Dell communications equipment, and endpoint protection with CrowdStrike. Disaster	Maintain continuous monitoring, update patches and firmware, and renew security licenses. Perform periodic disaster recovery tests.	Information Technology Department (ITD)

			recovery with VMware AWS.		
PACS (Radiology)	Servers located in ITD	Daily	Backup via Veeam and image archiving in the Philips cloud. Disaster recovery with VMware AWS.	Periodically validate clinical image recovery and storage growth. Maintain current support contracts and validate backups periodically. Perform periodic disaster recovery tests.	Philips

END OF DOCUMENT

Attachment F: Hospitaller and Medical Equipment

MEDICAL EQUIPMENT			
EQUIPMENT	**USAGE DESCRIPTION**	**EQUIPMENT SPECIFICATIONS**	**AMOUNT**
Surgical Table	The surgical table in trauma is used for quick and safe access to the patient.	Electro-hydraulic surgical table, suitable for surgical procedures and C-arm imaging. Capacity: 1,000 lb minimum lifting; 600lb minimum articulation. Motorized height and positioning: Trendelenburg, reverse Trendelenburg, lateral tilt, and minimum 210° tabletop rotation. Removable leg section and accessory rails. Rechargeable battery with hand and foot controls. Power:110 to 120 VAC at 50 t0 60Hz. 2-year warranty on parts and labor.	5
Surgical Lamp	The surgical light provides intense, uniform, and shadow-free illumination of the surgical field, allowing for precise visibility during procedures. It is adjustable in position, height, and intensity, and is	Ceiling-mounted dual LED lighting surgical system with two light heads, approximately 24" diameter each. Minimum illumination of 160,000 lux, with adjustable focus and intensity. Vertical movement of approximately 110° and continuous 360° rotation. CRI ≥95 and color temperature of 4,100-	5

	designed to prevent heat and glare.	4,500 K. Sterilizable center handle for positioning and control. LED life expectancy of approximately 40,000 hours. Electrical:110 to 120 VAC at 50 t0 60Hz. 2-year warranty on parts and labor.	
Anesthesia System	The anesthesia machine is the equipment that administers anesthetic gases and oxygen, controls the patient's ventilation, and allows monitoring of their respiratory functions during surgery.	Anesthesia workstation for adult and pediatric patients. Integrated ventilator with VCV, PCV, PCV-VG, SIMV-vC, SIMV-PG, SIMV-VG CPAP/PS and APRV modes. Tidal volume capability from 5 to 1,500 ml, with automatic compliance and leak compensation. Integrated HFNC up to 60L/min. Integrated monitoring of FiO_2, $ETCO_2$, N_2O and anesthetic gases, with automatic agent identification. 18.5" capacitive color touchscreen, with approximately 360° rotation. Integrated breathing system, electronic PEEP, automatic pre-use system check, and anesthetic gas scavenging system. Electrical: 120 VAC, 60HZ, hospital grade connection, with rechargeable battery backup.	5

Attachment F: Hospitaller and Medical Equipment

		5-year warranty on parts and labor.	
IV Pump (Intravenous Infusion Machines)	An IV pump is an infusion pump that delivers fluids and medications precisely and in a controlled manner intravenously. It allows for adjustments to volume, rate, and time, reduces dosing errors, and maintains a constant flow, making it essential in hospital wards, emergency departments, and trauma centers.	Includes: Wireless Battery, one-screen barcode technology, author-reprogramming workflows, line check notification. Dose error reduction software, Time check alert and Keypad Lock.	332
Transport Stretchers	Transport stretchers are used to move patients safely and stably within the hospital.	Hydraulic patient transport stretcher with integrated weighing scale, accuracy ≤ 0.5 kg and bed exit function. Safe working load: minimum 705 lb. Height approximately 55-89 cm (22-35in). Backrest adjustment 0-90° Trendelenburg/ reverse Trendelenburg ±18°. Four-section platform with adjustable things and calf sections. Retractable/folding side rails, minimum height	35

		approximately 36cm (14 in). 20cm (*in) casters with fifth steering caster for maneuverability. Integrated hydraulic controls, IV pole/push handles, and central braking system. Easy to clean construction suitable for hospital patient transport. 2-year warranty on parts and labor.	
Fixed Physiological Monitors	Fixed physiological monitors are devices installed in clinical areas that record and display vital parameters in real time, such as heart rate, blood pressure, oxygen saturation, respiration, and temperature.	Multiparameter patient monitor for adult and pediatric patients. Minimum monitoring: 12-lead ECG, SPO_2, NIBP, temperature, respiration, $EtCO_2$, and invasive pressure. Minimum capacity of 8 waveforms and 24 parameters. 12" or large color touchscreen with clinical alarms and trend storage. Rechargeable battery system suitable for patient transport. Wireless and wired network connectivity for central monitoring. Includes all required patient cables, sensors, probes, cuffs, leads, power cables, and	114

		accessories for the specified monitoring parameters. Includes clinical software license, all required software, and necessary connectivity for integration with the hospital monitoring system. Includes bedside mounting plate/bracket and all required mounting hardware. Electrical: 120 VAC, 60Hz, hospital grade connection. 5-year warranty on parts and labor.	
Nursing Monitoring Stations (Central Station 30 CH)	Central Station 30 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 30 patients channel simultaneously. Support for up to four high resolution touchscreen displays, with real time surveillance, waveforms, trends, and patient demographics. Integrated clinical access for review of retrospective patient data. Network access to hospital information systems and clinical data sources. Includes single user clinical software license and all required software	3 monitors per station (total 9) 3 printers

		for central monitoring. Includes 21.5" or large high-resolution touchscreen displays, as required for the configured system. Includes network laser printer for printing reports and patient monitoring data. Includes all required licenses, cables, network accessories, mounting hardware, and components for a complete operational system. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty on parts and labor.	
Nursing Monitoring Stations (Central Station 19 CH)	The Central Station 19 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 19 patients channel simultaneously. High resolution display with real time patient surveillance, waveforms, trends, and patient demographics. Clinical software for retrospective patient review. Network connectivity for integration with hospital information systems and central monitoring. Includes all required	2 monitors 2 printers

		software licenses, cables, network, accessories, and components for a complete operational system. Includes high-resolution touchscreen display, minimum 21". Includes laser printer for reports and monitoring data. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty on parts and labor.	
Nursing Monitoring Station 19 CH	The Central Station 19 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 19 patients channel simultaneously. High resolution display with real time patient surveillance, waveforms, trends, and patient demographics. Clinical software for retrospective patient review. Network connectivity for integration with hospital information systems and central monitoring. Includes all required software licenses, cables, network, accessories, and components for a	2 monitors & 1 printer

		complete operational system. Includes high-resolution touchscreen display, minimum 21". Includes laser printer for reports and monitoring data. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty required	
Portable Physiological Monitors	Portable physiological monitors are devices that allow monitoring of vital parameters such as blood pressure, heart rate, oxygen saturation and respiration during the transport or transfer of patients.	4 complete Multiparameter patient monitor for adult and pediatric patients. Minimum monitoring: 12-lead ECG, SPO_2, NIBP, temperature, respiration, $EtCO_2$, and invasive pressure. Minimum capacity of 8 waveforms and 24 parameters. 12" or large color touchscreen with clinical alarms and trend storage. Rechargeable battery system suitable for patient transport. Wireless and wired network connectivity for central monitoring. Includes all patient cables, ECG leads, SPO_2 sensors, Temperature probes, NIBP cuffs, $EtCO_2$ accessories, power cables, and accessories. Includes	4

		bedside mounting plate/bracket and all required mounting hardware for each monitor. Electrical: 120 VAC, 60Hz, hospital grade connection. 5-year warranty on parts and labor.	
Portable Defibrillators	Mobile defibrillators are portable devices used to treat serious arrhythmia and cardiac arrest by delivering controlled electrical shocks. They are lightweight, easy to carry, battery-operated, and feature an ECG monitor, automatic or manual modes, and alarms.	ALS defibrillator with manual/AED defibrillation, synchronized cardioversion, and external pacing. Integrated 3/5-leand ECG, SpO_2, $EtCO_2$, NIBP, and CPR quality feedback. CPR quality feedback. CPR monitoring with compression rate/depth and artifact filtering. NIBP and SpO_2monitoring for adult and pediatric patients. Sidestream $EtCO_2$ monitoring for intubated and non-intubated patients. Includes required ECG, SpO_2, NIBP, $EtCO_2$, pacing cables/sensors and accessories Wi-Fi/USB connectivity, rechargeable battery, and data storage. Electrical: 120 VAC, 60 Hz.	21

Attachment F: Hospitaller and Medical Equipment

		5-year warranty on parts and labor.	
Fixed Defibrillators	Fixed defibrillators are devices permanently installed in critical hospital areas to treat serious arrhythmia and cardiac arrest using controlled electrical shocks. They offer greater power, stability, and advanced features, including ECG monitoring, transcutaneous pacing, manual/automatic modes, and event logging.	Semi-automatic AED, English/Spanish language with voice and visual prompts and integrated real-time CPR feedback. Rectilinear biphasic waveform with automatic adult energy selection of 120J, 150J, and 200J. CPR feedback for compression depth and rate, with a minimum recommended compression depth of 2 inches (5 cm). Adult CPR/defibrillation electrodes with integrated CPR sensor and minimum 5-year shelf life; pediatric capability with compatible pediatric electrodes. Includes 10 lithium batteries system with approximately 5-year standby life and capacity for extended operation. Includes wall-mounted metal cabinet with audible alarm and AED identification signage compliant with applicable Puerto Rico requirements. AED and accessories shall be supplied as a complete, ready-to-use system. 5-	3

		year warranty on parts and labor.	
Transport Monitors	Transport monitors are portable devices that allow monitoring of the patient's vital signs during transport within or outside the hospital.	High-acuity transport patients monitor for adult and pediatric patients. 8" or large touchscreen display with visible alarm indicator. Supports minimum 11 clinical parameters, including 12-lead ECG, SpO_2, NIBP, temperature, respiration, and sidestream $EtCO_2$. Integrated rechargeable battery provides minimum 5 hours of continuous operation. Wireless Wi-Fi connectivity and compatibility with the hospital central monitoring system and electronic medical record. Storage of graphical and tabular trends and patient data. Compact, lightweight design with integrated carrying handle and mounting capability for IV pole or bed rail. Impact-resistant construction capable of withstanding a minimum 1- meter drop. Includes all required patient cables, sensors, probes, cuffs, and mounting hardware for a complete operational system. Electrical: 120VAC, 60Hz. 5-year warranty on parts and labor.	39

Attachment F: Hospitaller and Medical Equipment

Computer Tomography	The CT scanner uses X-rays and advanced computing to obtain detailed cross-sectional images of the body. It allows for the visualization of organs, bones, and tissues with high precision, making it essential for diagnosing trauma, bleeding, fractures, internal injuries, and complex pathologies.	Multi-slice CT System for full-body diagnostic imaging. High-performance X- ray generator and tube with advance thermal management. Solid-state detector with high spatial resolution and extended coverage. Gantry aperture ≥ 70cm. Gantry rotation time ≤ 0.35 seconds. High-pitch helical acquisition capability. Motorized patient table with minimum load capacity of 500 lb. Automatic patient positioning with laser alignment system. Dose reduction technologies including automatic tube current modulation. Iterative reconstruction and AI-based image reconstruction. ECG-gated acquisition for cardiac imaging. High-speed acquisition and reconstruction for emergencies and routine use. GPU-accelerated reconstruction system. Advance workstation with MPR, 3D and volumetric	1

		analysis tools. Full DICOM compliance with PACS/RIS integration. Patient communication system(audio/Visual) Integrated operator console for acquisition and post-processing. Electrical compatibility with site configuration 480V/208 V, (3-phase power) UPS compatibility with minimum 7-10 minutes autonomy. Designed for continuous high-volume hospital operations. 5-year warranty on parts and labor.	
Fixed X-Ray Machine	A fixed X-ray machine is a permanently installed piece of equipment used to obtain radiographic images of the body using X-rays. It produces rapid studies of bones, the chest, and internal structures, essential for diagnosing fractures, traumatic injuries, infections, and acute conditions.	Ceiling-Mounted digital radiography system for general, trauma, pediatric, INCU, chest, spine, and full-body examinations. X-ray generator: minimum 150kW and 65kW. Digital Flat-panel detector: 35x43 cm (14"x 17") pixel size ≤160µm. Motorized height-adjustable table with minimum 825 lb patient capacity. Motorized ceiling tube suspension with integrated collimation, positioning controls, and	1

		live positioning camera. Automatic Exposure control with manual and automatic exposure techniques. Advanced image processing, dose optimization, and stitching for full-spine/full-leg imaging. Operator workstation with 21" or large color display, image acquisition, processing, storage, and review. DICOM connectivity for PACS/RIS and hospital network integration. Includes complete installation, calibration, testing, commissioning, software, detector, accessories, and required system components. 480V/208 V, (3-phase power) UPS compatibility with minimum 7-10 minutes autonomy. Designed for continuous high-volume hospital operations. 5-year warranty on parts and labor.	
Portable X-Ray Machine	The portable X-ray machine is a mobile device that allows X-rays to be taken directly at the patient's bedside.	Mobile digital X-ray system for bedside, ICU, emergency, Trauma, OR and general radiography. Generator with 10-500 mA, 0.1-500 mAs, and	1

		exposure times of 0.001-1.25 seconds. Wireless digital flat-panel detector, suitable for general radiography. 21.5" or larger color display with DICOM-compatible image acquisition and review. Motorized drive system with precise tube positioning and compact maneuverability. Rechargeable lithium-ion battery, providing minimum 8 hours of operation/ mobility and rapid charging. Advanced image processing with scatter correction and nose/artifact reduction. Wireless connectivity and DICOM/ PACS integration. Includes all required detectors, cables, batteries, chargers, software, accessories, installation, calibration, and commissioning. Electrical 120VAC, 60 Hz. 5-year warranty on parts and labor.	
Intermediate beds	Intermediate care beds are used for patients requiring continuous	Electrical critical care bed with integrated patient weighing system, accuracy ≤0.5 Kg. Safe	85

	monitoring, but not at the level of intensive care. They allow for basic and advanced monitoring, have safety rails, height and position adjustments, and facilitate the care of stable patients at moderate risk.	working load: minimum (550 lb.) patient capacity. Electrical height adjustment approximately 16-32in. Motorized Trendelenburg/Reverse Trendelenburg ±14°, backrest and thing adjustment. Adjustable split side rails, bed extension, and patient positioning functions. Integrated patient controls, caregiver controls, and bed-exit/position safety features. Heavy-duty casters with central braking system and fifth steering wheel/caster for enhanced maneuverability and directional control. Easy-to-clean, corrosion-resistant construction suitable for critical care. Includes integrated scale, mattress platform, all required controls, cables, battery, accessories, and mounting components. Electrical 120 VAC, 50/60 Hz. 3-year warranty on parts and labor.	
Intensive Care Beds	Intensive care beds are designed for critically ill patients	Electric critical care bed with automatic lateral tilt/ therapy up to ±30° and	38

	requiring continuous monitoring and advanced support. They offer multiple positions, electric adjustments, secure side rails, integrated weighing, compatibility with monitoring equipment, and easy access for procedures.	programmable lateral therapy. Minimum safe working load: 550lb. 8" or large touchscreen with integrated patient/caregiver controls. Electric positioning including Trendelenburg/ reverse Trendelenburg, vascular position, and one-touch full chair position. Electronic and manual CPR, electronic braking system, and multi-zone bed-exit alarm. C-arm compatible radiolucent mattress platform for bedside imaging. Integrated sit-to-stand mobilization system and foot-pedal controls. Fifth steering caster for enhanced maneuverability and central braking system. Dual accessory outlets: 120 VAC. Includes required battery, cables, controls, accessories, and mounting components. Electrical 120 VAC, 50/60 Hz. 3-year warranty on parts and labor.	
Ventilator	Mechanical ventilators are devices that assist or	ICU ventilator for adult and pediatric patients with advanced invasive,	43

	replace the patient's breathing, administering air and oxygen with controlled volume, pressure, and frequency.	non-invasive, and high-flow oxygen therapies. Advance ventilation modes including ASV, pressure/volume control, SIMV, APRV, NIV, and high-flow o_2. Tidal volume range of 20-2,000 ml and high inspiration flow capability. 17" or large detachable touchscreens with real-time waveforms, loops, trends, alarms, and advance lung mechanics monitoring. Integrated humidification system with H 900- equivalent humidifier, including required support and controls. Integrated turbine, leak compensation, oxygen monitoring, and automatic pre-use checks. Rechargeable battery system providing minimum 1.5 hours operation, expandable to approximately 3 hours with additional battery. Includes trolley, power cord, oxygen DISS connector, tubing support arm, communication interfaces, sensors, cables, and all required accessories. Electrical 120	

		VAC, 60 Hz. 2-year warranty on parts and labor.	
MRI Ventilator Fans	MRI-compatible ventilators are devices designed to operate safely within the magnetic resonance imaging (MRI) environment, where extremely strong magnetic fields are present. They are constructed from non-ferromagnetic materials, use remote control systems, and enable advanced ventilation modes for critically ill patients requiring respiratory support during MRI scans.	High acuity ventilator for adult, pediatric, and Neonatal patients, suitable for intrahospital transport and MRI procedures. MR conditional for 1.5 T and 3.0 T MRI systems, with integrated magnetic field monitoring and safety alarms. Advanced ventilation including volume/pressure control, ASV, DuoPAP/APRV, NIV/NIV-ST, and high-flow o_2. Integrated turbine with no compressed air requirement and automatic leak compensation. 8" or large color display with waveforms, loops, trends, monitoring, and alarms. Rechargeable lithium-ion battery providing minimum 3 hours continuous operation; extended operation with additional battery capacity. Includes trolley, oxygen hose, high pressure O, connector, power cord, batteries, expiratory valve,	2

		HEPA/dust filters, oxygen cell, breathing circuit support, and required software and all accessories. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
Multi-parameter beds with lateral rotation	Multiparameter beds with side rotation are designed for critically ill patients requiring continuous, effortless mobilization. They feature automatic side turns, help prevent pressure ulcers, improve pulmonary ventilation, reduce respiratory complications, and facilitate patient care.	Advance electric ICU bed with minimum 650 lb safe working load. Powered therapeutic surface with pressure redistribution, microclimate management, and pulmonary therapy. Integrated continuous lateral rotation and percussion vibration therapy. Full electric positioning including Trendelenburg, reverse Trendelenburg, cardiac chair, and sit-to-stand. Automatic lateral positioning, head of bed angle monitoring, and 3 mode bed exit alarm. C-arm compatible radiolucent sleep deck with unrestricted imaging access. Early mobility system with assisted sit to stand and patient mobilization. Powered transport system with fifth wheel steering and	3

		central braking. Integrated patient caregiver controls with battery backup and accessory outlets. Includes mattress surface, battery, cables, controls, IV pole accessories, and all components required for full ICU configuration. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
Enteral Feeding Machine	An enteral feeding machine is a device that delivers liquid nutrition in a controlled manner through feeding tubes (nasogastric, gastrostomy, or jejunostomy). It regulates rate and volume, ensures a safe and continuous supply, prevents flow variations, and is essential for patients who cannot feed orally.	Volumetric enteral feeding pump for continuous and intermittent feeding, hydration, and thick formulas. Feed rate: 1-400mL/he, think formula: 1-200mL/hr, programmable feed and flush volumes. Automatic Feed & Flush with programmable intervals and auto-priming. Accuracy of ±5% or better with standard formula. Compatible with think, homogenized and blenderzed formulas, including IDDSI levels 2-4. Attitude independent operation with no drip chamber 20-hour minimum battery life and rechargeable battery. 30	43

		days feeding and flushing history, with interruption monitoring and audible and visual alarms. IPX6 Water resistant design, suitable for cleaning under running water. Includes pole clamp, AC power adapter, rechargeable battery, feeding sets with ENFit™ connections, and all required accessories for operation. Electrical 120 VAC, 60 Hz. 1-year warranty on parts and labor.	
Warming Unit for Blanket	Patient warming machines are devices that deliver controlled warm air to special heated blankets to maintain or raise a patient's body temperature. They help prevent hypothermia, improve hemodynamic stability, and reduce complications during surgery, trauma, and recovery.	Force-air patient warming unit for adult and pediatric patients, with rolling cart. Four temperature settings: ambient, 32°C, 38°C, and 43°C, with temperature accuracy of ±3°. Airflow up to 44 CFM (20.8 L/S) with quiet operation, approximately 50dBA. Audible and visual alarms for over temperature, and system faults. Detachable flexible hose, filter-change indicator, and MERV 14 filtration. Compatible with force-air warming blankets and gowns; suitable for surgical and	53

		clinical environments. Includes rolling cart, hose, power cord, filter, temperature test accessory, and required mounting and accessories. Electrical 120 VAC, 60 Hz. Comply with applicable IEC 60601-1 electrical safety requirements and IPX1 protection. 1-year warranty on parts and labor.	
Automated device for delivering compressions	The Mechanical CPR is an automated device that performs continuous, high-quality mechanical chest compressions during cardiopulmonary resuscitation (CPR). It maintains ideal rhythm, depth, and rate, reduces staff fatigue, allows CPR to continue during patient transfers or procedures, and improves safety and effectiveness in cardiac arrest, emergency, and trauma situations.	Automated mechanical CPR system for adult patients, providing patient-customized circumferential chest compressions. Compression rate: 80 ±5 compressions/min, with 30:2 and continuous compression modes. Automatic patient sizing for chest circumferences of 30-56in (76-142 cm) and patient weight up to 400lb. Chest compression depth equivalent to approximately 20% reduction in anterior-posterior chest depth. Radiolucent platform suitable for imagining and fluoroscopy during CPR.	32

		Dual-sided control panels for operation in confined spaces and during patient transport. Rechargeable Li-ion battery system, including spare battery and dual-bay charger. Includes platform, compression band, batteries, charger, and all required accessories for operation. USB data transfer and performance report capability. IP44 or higher protection and compliance with applicable IEC 60601-1 requirements. 3-year warranty on parts and labor.	
Vital Signs Monitor with Cart	The vital signs monitor with cart is a portable device mounted on a mobile base that allows for the monitoring of vital parameters such as blood pressure, pulse, oxygen saturation, temperature, and respiration. The cart facilitates mobility, stability, and quick access, enabling its use in emergency,	Vital Signs monitor with SpO_2, NIBP, pulse rate, and predictive oral temperature. 8" color capacitive touchscreen, with hard keys, control knob, and 360° visual alarm indicator. NIBP with manual, automatic, and continuous measurement modes. SpO_2monitoring with reusable adult sensor and extension cable. Predictive temperature measurement with	48

	hospital, trauma, and procedures where continuous monitoring and easy transport of the equipment are required.	accuracy ±0.1°C or better. Rechargeable lithium-ion battery with minimum 3.5 hours of operation. Built-in Wi-Fi, USB, network connectivity, and nurse-call interface for clinical data integration. Includes rolling stand with mounting plate, adult SpO_2 sensor, NIBP cuff and tubing, temperature probe/accessories, battery, power cord, and all required cables. Electrical: 120 VAC, 50/60 Hz operation. 3-year warranty on parts and labor.	
Fetal and Maternal Monitor	The fetal and maternal monitor is a device that records fetal heart rate, uterine contractions, and maternal signs such as pulse and blood pressure.	Fetal and Maternal monitor with dual FHR monitoring for twin pregnancies. Monitoring of FHR, TOCO, fetal movement, maternal ECG/HR, SpO_2, NIBP, and temperature, Supports DECG and IUP monitoring for advanced labor assessment. 12.1" color touchscreen with simultaneous wave form and numeric display. Integrated thermal recorder with selectable	1

		speeds of 1, 2, and 3 cm/min, and 25mm/sec for ECG/history data. Internal rechargeable Li-ion battery, minimum 14.8 V/ 4.4 Ah. USB and RS-232 connectivity with clinical data/software capability. Includes twin FHR/TOCO transducer, maternal SpO_2 Sensor, NIBP cuff and tubing, temperature accessories, ECG cables, DECG/IUP accessories, printer supplies, battery, power cord, and all required accessories. Includes rolling stand and /or wall-mount configuration. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
MRI-compatible intravenous infusion pump	The MRI-compatible intravenous infusion pump is a device designed to operate safely within the magnetic resonance imaging (MRI) environment, where magnetic fields are very strong. Constructed from non-ferromagnetic materials, it does not	Non-magnetic IV infusion system specifically designed for use during MRI procedures from 0.2T to 3.0T, operational up to 10,000 gauss. Infusion rate range: 0.1-1,400mL/hr, suitable for neonatal, pediatric, and adult patients. Non-magnetic ultrasonic motor with accurate fluid delivery and dose-rate calculator	2

	interfere with the image and maintains precise and continuous infusions during MRI scans of critically ill patients.	and programmable bolus. Integrated safety features including inlet/outlet occlusion detection, and free-flow prevention. Rechargeable lithium battery providing approximately 12 hours of operation. Numeric keypad with audible and visual alarms and infusion status indicators. Includes non-magnetic mobile IV pole, battery, charger, power cord, and MRI compatible disposable IV tubing sets. System shall be latex-free and DEHP-free. Electrical 120 VAC, 60 Hz. 1-year warranty on parts and labor.	
MRI Compatible Cardiac Monitor	The MRI-compatible cardiac monitor is a device designed to operate safely within the magnetic resonance imaging environment, where very strong magnetic fields exist. It is constructed of non-ferromagnetic materials, does not interfere with the images, and allows for the recording of	Portable, non-magnetic patient monitor specifically designed for MRI Zone IV, operating safely in magnetic fields up to 30,000 gauss. Continuous monitoring of ECG, SpO_2, NIBP, $EtCO_2$, temperature, and invasive blood pressure (IBP). Wireless ECG with dynamic gradient filtering and wireless patient parameter modules. 360° visual severity-based	2

	ECG, heart rate, respiration, and oxygen saturation during the scan.	alarms. High-resolution touchscreen display with real-time waveforms, trends, alarms, and patient data. Extended-range wireless communication between the patient monitor and MRI control room. Rechargeable battery system with integrated charging for monitor and wireless modules. Compatible with remote control/ viewing station for monitoring inside MRI Zones III and IV. HL7 and RS-232 connectivity for EMR/clinical information system integration. Includes all required ECG, SpO_2, NIBP, $EtCO_2$, cables, sensors, modules, batteries, chargers, mounting hardware, and accessories. Includes non-magnetic mounting/roll stand suitable for MRI-ready and fully operational, including installation, configuration, testing, and user training. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	

Hemodynamic Monitors	Hemodynamic monitors are advanced devices that assess the cardiovascular status of critically ill patients in real time. They measure parameters such as invasive blood pressure, cardiac output, venous oxygen saturation, central venous pressure, and other variables that allow for the determination of cardiac perfusion and function.	Non-invasive continuous hemodynamic monitoring using bioreactance technology. Measure displays Cardiac output (CO_2), Stroke Volume (SV), Stroke Volume Index (SVI), and Total peripheral Resistance (TPR). Provides dynamic fluid-responsiveness assessment using Passive Leg Raise (PLR) and fluid bolus testing. NIBP and SpO_2 monitoring integrated. Real-time monitoring with trends and hemodynamic assessment reports. Patient sensors positioned on the chest/back; minimum 25 disposable sensors included. Passive Leg Raise lift capable of positioning the patient's legs at approximately 45°. Includes patient cable, NIBP cuff and tubing, SpO_2 accessories, power cord cable, rechargeable battery, and all required cables and accessories. Includes rolling stand with five caster wheels and locking brakes. Compatible with connectivity to external	4

		patient monitors through appropriate interfaces. Including installation, calibration, and user training. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
ECMO	ECMO (Extracorporeal Membrane Oxygenation) is an advanced life support system that oxygenates the blood and partially replaces the function of the heart and/or lungs. It removes blood from the patient, oxygenates it using an artificial membrane, and returns it to the body. It is used in severe respiratory failure, cardiogenic shock, cardiac arrest, and severe trauma, providing time for recovery while maintaining perfusion and oxygenation.		2
Equipment for high-frequency oscillation of the chest wall (Oxilator)	The high-frequency chest wall oxystrator is a device that applies rapid vibrations and	High-frequency oscillatory (HFOV) for adult and pediatric patients, including patients ≤35 Kg.	4

	external compressions to the chest to help loosen and mobilize pulmonary secretions. It uses a pneumatic vest connected to a machine that generates high-frequency air pulses. It is essential for patients with thick mucus, lung diseases, chest trauma, and difficulty expectorating, improving ventilation and airway clearance.	Active inspiration and active expiration for lung-protective ventilation. Adjustable frequency: 3-15 Hz (180-900 breaths/min) Adjustable mean airway pressure, oscillatory amplitude/ power, inspiratory time and bias flow. Continuous airway-pressure monitoring with audible and of visual alarm for pressure, gas supply, power and system faults. Dedicated patient circuits available for adult and pediatric patients, including appropriate circuit configurations for different patient weights. Complete heated humidification system, including humidifier, chamber, temperature probe and mounting hardware. Include air/O_2 bender, medical air and oxygen hoses with DISS connections. Includes complete patient circuits, circuit support arm/cradle, water trap, filters and all required pressure-sensing components. Includes rolling base cart and all	

		required mounting accessories. Includes power cord, gas hose, initial patient circuits, filters and consumables required for initial operation. Medical air and oxygen supply compatible with hospital DISS outlets. Electrical: 120 VAC, 60Hz, hospital grade power connection. Includes installation, calibration, preventive maintenance documentation, operational testing and user training. 1-year warranty on parts and labor.	
Thromboelastogram	A thromboelastogram is a test that evaluates the entire coagulation process in real time: how a clot forms, strengthens, and dissolves. It analyzes the function of platelets, fibrinogen, coagulation factors, and fibrinolysis, providing a comprehensive view of hemostatic status. It is essential in	Automated viscoelastic whole-blood hemostasis analyzer using single-use microfluidic cartridges. Ability to perform up to four assays simultaneously without manual reagent mixing or pipetting. Provides comprehensive assessment of clot strength, fibrin contribution, clot stability/lysis, and platelet function. Supports global hemostasis and platelet function testing, including	2

	trauma, major surgery, massive bleeding, and anticoagulation management, helping to make accurate decisions about transfusions.	ADP and AA platelet response. Results available rapidly, with automated analysis and graphical/numerical results. Integrated quality control and self-monitoring functions. Touchscreen interface with patient identification, test status, results and graphical interpretation. Ability to store and retrieve patient results and graphical interpretation. Ability to store and retrieve patient results and connect to hospital network/software for remote results viewing and data management. Compatible with barcode scanner and USB printer. Includes analyzer, power supply, required cables, barcode scanner, printer, and initial supply of hemostasis and platelet-function cartridges, including QC materials. Electrical: 120 VAC, 60Hz. Includes installation, configuration, calibration, verification, user training and documentation. 1-year warranty on parts and labor.	

Attachment F: Hospitaller and Medical Equipment

Machine for heating fluids and blood (Ranger)	The Ranger is a system that warms intravenous fluids and blood to a safe temperature before administering them to the patient. It uses a rapid and controlled heating mechanism, preventing hypothermia associated with transfusions or massive infusions.	Blood and fluid warming system using dry-heat technology, without water reservoir Designed to warm blood products, and IV fluids during administration. Adjustable flow capability from KVO to 500mL/min, with pediatric, standard, and high-flow disposable sets. Fluid output temperature maintained approximately 33-41 °C, with 41°C set point and warm-up time of less than 2 minutes. Audible and visual alarms for over-temperature and system faults, with automatic temperature monitoring and safety cutoff. Sterile, single-use warming sets, latex-free and DEHP-free, capable of handling pressure up to 300 mmHg. Includes warming unit, IV-pole mounting capability, power cord, cleaning tool, temperature verification accessory, and initial warming sets for pediatric, standard, and high-flow applications.	5

		Electrical: 120 VAC, 60Hz, maximum heating power approximately 900W. Compliable with applicable IEC/EN 60601-1 medical electric safety requirements. 1-year warranty on parts and labor.	
Electrocautery	Electrocautery is a surgical device that uses electrical energy to cut tissues and control bleeding through coagulation.	Advanced electrosurgical energy platform for monopolar, bipolar, vessel sealing, and bipolar resection. 7" or large color touchscreen with intuitive controls, procedure information, instrument recognition, and system status. Monopolar modes for cut and coagulation. Bipolar modes for cut and coagulation, including bipolar resection. Advance bipolar vessel sealing technology for sealing and dividing vessels and tissue bundles according to the validated specifications of the proposed instruments. Automatic tissue sensing and energy modulation to optimize energy delivery according to tissue	5

		characteristics and provide constituent sealing performance. Return- electrode monitoring with automatic interruption of energy delivery when unsafe conditions are detected. Audible and visual alarms for system faults, improper connections, instrument incompatibility, and safety conditions. Multiple connections for monopolar and bipolar instruments. Includes monopolar, footswitch, bipolar/resection footswitch, universal mounting/ transport cart, power cord, required cables, accessories necessary for complete operation. Electrical: 120 VAC, 60Hz. Maximum power consumption approximately 950VA. Compliance with applicable IEC 60601-1 and IEC 60601-2-2 standards, Includes installation, operational verification, user training, and technical support. 1-year warranty on parts and labor.	

QNRG+ Metabolic Monitor Calorimeter	The QNRG+ is a metabolic monitor that measures the patient's actual energy expenditure using indirect calorimetry.	Indirect calorimetry system for measurement of Resting Energy Expenditure (REE) in mechanically ventilated and spontaneously breathing patients. Measures VO_2, VCO_2, Respiratory Quotient (RQ), REE/RMR, and substrate utilization (%fat, % carbohydrate, % protein). Measurement range: VO_2 and VCO_2 10-1,000mL/min. REE range: 0-7,200 Kcal/day. Accuracy: VO_2/VCO_2±3% or 5mL/min; REE± or 36 Kcal/day. Integrates O_2 and CO_2 gas analyzers with automatic calibration. Ventilator mode with disposable flow measure and compatibility with mechanical ventilators. Capable of testing with canopy hood and face mask for spontaneously breathing patients. 10" or large color capacitive touchscreen with real-time metabolic data and graphical display. Internal rechargeable Li-ion battery, minimum 3 Hours	4

		operation. Data export formats: USB, PDF, CSV and XML. Includes metabolic monitor, rolling cart with cylinder holder, power cable, USB cable, required tubing/adapters and accessories. Includes certified calibration gas: 16% O_2, 5% CO_2, balance N_2, with regulator/cylinder connection as required. Includes required single-use flow measurement and gas sampling components for initial operation. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
Gradual compression pumps for anti-embolism stockings	Graduated compression pumps are devices that apply sequential and automatic pressure to the legs using special stockings or sleeves. Their purpose is to improve venous return and prevent deep vein thrombosis.	Sequential pneumatic compression system for DVT prophylaxis. Patient detection to verify proper garment application and therapy. Vascular refl detection (VRD) with automatic adjustment of compression cycle. Graduated sequential compression for thing, calf, and foot therapy Unilateral or bilateral therapy. LCD display with audible/visual alarms.	143

Attachment F: Hospitaller and Medical Equipment

		Rechargeable battery with minimum 8 hours operation. Includes controller, tubing, battery/ charger, power cord, and required compression garments battery, charge, power cord and all required accessories. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
Portable Bronchoscope	It is used to assess and manage the airway in trauma situations, especially when there is a difficult airway, suspected tracheobronchial injury, or internal bleeding.		1
PCA Pumps	They are used for acute pain when continuous and safe analgesia is required.		4
BIS Monitors	It estimates the level of sedation/anesthesia by analyzing brain electrical activity using EEG.		1
CRRT Machine	It is a machine for continuous renal replacement therapy used in critically ill patients with acute		10

	kidney failure, especially when they are hemodynamically unstable and cannot tolerate intermittent hemodialysis.		
C Arm	It is a mobile fluoroscopy unit used to obtain real-time radiographic images during surgical or interventional procedures.		2
I-Stat Laboratory	The I-STAT is a portable point-of-care (POC) analyzer that provides rapid results in minutes from blood samples without sending them to a laboratory. It uses disposable cartridges specific to each type of test (arterial blood gases, electrolytes, BUN, creatinine, lactate, troponin, coagulation, etc.).		4

Table A: Medical Equipment

GENERAL CONDITIONS FOR MEDICAL EQUIPMENT

1. Equipment Demonstration: If required, the Contractor will bring a demonstration unit of the equipment to be quoted or coordinate a visit to a facility within Puerto Rico that has it in use. The date and time of the demonstrations will be communicated by the Purchasing Division. The evaluation of the presented equipment is a mandatory requirement and will be used as part of the evaluation of the quote submitted as part of the execution of the Allowance.

2. Electrical Requirements:

    a. In the event of a low voltage event, the equipment must be protected by an uninterruptible power supply (UPS) designed to meet the equipment's electrical requirements.
    b. All proposed equipment must comply with all applicable medical and electrical safety standards.
    c. Applicable electrical risk classifications for direct patient care areas must be met.
    d. The equipment must clearly specify its voltage, current, phase, frequency, and required power.
    e. The supplier must indicate if the equipment requires dedicated circuits, special grounding systems, or additional protection through suitable switches and include these in their quotation.
    f. The equipment must have protection against voltage fluctuations, overload, transient voltage, and electrical spikes.
    g. It must be ensured that the equipment can safely restart after a power outage or power transfer.

3. IT Connectivity and Network Requirements:

    a. The supplier must specify the network requirements (Ethernet, ports, connection type, minimum speeds, IP addresses, VLANs, etc.).
    b. When the equipment requires connection to the HIS, PACS, EMR, or other hospital systems, it must comply with standard protocols (HL7, DICOM, FHIR, etc.).
    c. The supplier must include all cables, adapters, network modules, or interfaces necessary for proper connection.
    d. The Contractor shall ensure that all cabling meets hospital standards (medical grade cabling, labeling, separation of power and data lines).

4. Information Security:

    a. The equipment must comply with the institution's cybersecurity policies.
    b. It must have protection mechanisms against unauthorized access, malware, and common vulnerabilities.
    c. Security-related software updates must be provided free of charge for the equipment's lifetime. d. Transmitted data must be encrypted according to security standards.

5. The Contractor shall submit to ASEM electrical installation and IT configuration manuals; provide plans, connection diagrams, network profiles, UPS specifications and required electrical parameters, including any additional requirements at ASEM's request.

6. The Contractor will be responsible for properly integrating and verifying all electrical and network connections necessary for the operation of the equipment. The Contractor will also be responsible for coordinating with the Engineering and IT Departments to ensure compatibility and proper operation.

7. Compliance with Applicable Standards and Regulations:

    a. All proposed equipment must be FDA-approved.
    b. All medical equipment must comply with HIPAA, if applicable.
    c. All equipment that records patient information and images must use the latest version of HL7 and DICOM, as applicable.

8. When the equipment requires cooling, ventilation, humidity control, or special environments for electrical or IT components, this must be considered in your quote.

9. Quotation: As part of the Allowance execution process, the Contractor must include manufacturer literature, diagrams, drawings, and related documents containing all explicitly detailed information regarding each of the requested specifications or conditions (referring the specification number being addressed). The quotation price must include FOB/CIF ASEM freight and transportation costs, as well as all applicable state taxes.

10. Safety: The Contractor shall be responsible for maintaining and monitoring all safety precautions and programs during the transportation, delivery, installation and testing of the equipment.

11. The equipment must comply with EMC standards to avoid interference with other sensitive medical devices. b. The supplier must certify that the equipment does not emit electromagnetic radiation levels outside of regulated limits.

12. It is the Contractor's responsibility to submit all structural, mechanical, electrical, HVAC, and lighting drawings, as well as any related specifications for the pre-installation and/or preparation of the designated installation area, to ASEM for approval.

All submitted drawings, specifications, and other documents must comply with all applicable state and federal regulations. Approved and final drawings must be submitted to ASEM at least three (3) weeks prior to the scheduled installation date. Failure to comply with this requirement will make the Contractor responsible for completing the necessary work.

13. Installation: The Contractor shall be responsible for providing all materials and/or miscellaneous items necessary for the installation and complete operation of the system and/or equipment. Installation includes the transport or relocation of all parts and/or materials to the designated installation area. It also includes all accessories and/or parts necessary for the optimal functioning of the system offered. Finally, the Contractor shall install all safety and security measures, including signs, notices, and other warning announcements, during installation and testing to promote safety and alert patients and employees in adjacent areas.

14. Operation and Service Manuals: The Contractor must provide ASEM with two (2) sets of operational manuals and two (2) sets of service manuals (theoretical and schematic) for all system and/or equipment components. These must be submitted before system and/or equipment certification. These manuals must contain the following: schematic diagrams, installation drawings, information on calibration procedures, spare parts lists, system views with properly numbered parts, and safety precautions, among other related aspects.

15. Certification: Certification will be performed by ASEM's Biomedical Instrumentation Division personnel, who will be present during the system installation, calibration, and optimization phases (which may include clinical trials). This certification will not be issued until: (1) the Contractor delivers all system components and/or equipment to ASEM, (2) the Contractor has completed the necessary tests, and (3) ASEM has received the corresponding certificates.

16. Operational Training: The Contractor shall be responsible for providing all operational training to designated ASEM personnel (including clinical trials). This training shall be provided at ASEM facilities for a minimum period of two (2) years. It shall include the use, operation, and applications of the system, as well as the safety rules for the equipment. If required, the company should provide further training sessions free of charge. Each participant shall receive a certificate of completion of training.

17. The Contractor will provide factory-trained technical service and repair training to a minimum of two (2) Biomedical Technicians selected by ASEM. The quoted cost of the training will include all related expenses (including training, transportation, and meals). Topics to be covered must include troubleshooting, maintenance, calibration, and repair of each system component. Each participant will receive a certificate of completion of the training.

18. All equipment, accessories, and parts will be guaranteed for a minimum period of two (2) years. This period will begin ten (10) calendar days after the certification of the entire system. The warranty will include parts, labor, service, and maintenance.

19. Equipment or system maintenance will include attention to the physical aspects of the equipment (corrosion, paint, and aesthetics), as well as all electrical and mechanical parts and components, piping, and other elements related to the proposed system(s). Furthermore, it must cover the complete operational functioning of the equipment.

    The supplier must guarantee the availability of preventive and corrective maintenance services throughout the equipment's lifespan. This includes inspections, calibrations, adjustments, parts replacement, and operational verification of all components.

20. Any equipment problems or malfunctions during the term of the contract must be addressed and corrected within a period of no more than twenty-four (24) hours. The supplier will be responsible for maintaining a complete inventory of the most frequently requested spare parts in Puerto Rico in order to minimize equipment downtime. The service will include all electrical and mechanical parts and components, piping, and other elements necessary for all parts of the proposed system(s).

    Repairs must be carried out by trained biomedical personnel with experience in the particular system or equipment.

21. Updates:

    a. All mandatory updates or those required by regulatory agencies must be made available to ASEM immediately and free of charge for the entire lifespan of the equipment.

b. All updates that add new options or modes and do not require new hardware must be made available to ASEM immediately and free of charge for the lifespan of the equipment.

c. Operational training on these updates must be provided free of charge to all personnel designated by ASEM at ASEM facilities.

22. Certificates of compliance or other evidence demonstrating compliance with the conditions and specifications set forth in the RFP documents may be required.

23. All medical equipment, accessories, components, and biomedical services must comply with all applicable state and federal laws, regulations, and standards, including but not limited to those of the FDA, OSHA, NFPA, EPA, and any other relevant regulatory agencies. The Supplier or Contractor must provide evidence of compliance when requested.

24. The Supplier or Contractor will be responsible for the complete installation of the equipment, including site preparation, provision of all necessary materials, and verification of initial operation. All installations must be performed by certified technical personnel and in accordance with the manufacturer's specifications.

25. The supplier shall maintain an adequate inventory of critical or high-demand spare parts in Puerto Rico in order to minimize equipment downtime and ensure operational continuity.

26. Any equipment that uses, processes, or stores sensitive information must comply with applicable privacy and security regulations. The supplier must guarantee data protection, data backups, and measures against unauthorized access.

27. The supplier will be responsible for any damage to equipment, property, or third parties caused by installation errors, improper maintenance, inadequate training, or failure to comply with specifications.

HOSPITALLER			
EQUIPMENT	**USAGE DESCRIPTION**	**EQUIPMENT SPECIFICATIONS**	**AMOUNT**
Surgical Table	The surgical table in trauma is used for quick and safe access to the patient.	Electro-hydraulic surgical table, suitable for surgical procedures and C-arm imaging. Capacity: 1,000	5

		lb minimum lifting; 600lb minimum articulation. Motorized height and positioning: Trendelenburg, reverse Trendelenburg, lateral tilt, and minimum 210° tabletop rotation. Removable leg section and accessory rails. Rechargeable battery with hand and foot controls. Power:110 to 120 VAC at 50 t0 60Hz. 2-year warranty on parts and labor.	
Surgical Lamp	The surgical light provides intense, uniform, and shadow-free illumination of the surgical field, allowing for precise visibility during procedures. It is adjustable in position, height, and intensity, and is designed to prevent heat and glare.	Ceiling-mounted dual LED lighting surgical system with two light heads, approximately 24" diameter each. Minimum illumination of 160,000 lux, with adjustable focus and intensity. Vertical movement of approximately 110° and continuous 360° rotation. CRI ≥95 and color temperature of 4,100-4,500 K. Sterilizable center handle for positioning and control. LED life expectancy of approximately 40,000 hours. Electrical:110 to 120 VAC at 50 t0 60Hz. 2-year warranty on parts and labor.	5

Attachment F: Hospitaller and Medical Equipment

Anesthesia System	The anesthesia machine is the equipment that administers anesthetic gases and oxygen, controls the patient's ventilation, and allows monitoring of their respiratory functions during surgery.	Anesthesia workstation for adult and pediatric patients. Integrated ventilator with VCV, PCV, PCV-VG, SIMV-vC, SIMV-PG, SIMV-VG CPAP/PS and APRV modes. Tidal volume capability from 5 to 1,500 ml, with automatic compliance and leak compensation. Integrated HFNC up to 60L/min. Integrated monitoring of $Fi0_2$, $ETCO_2$, N_2O and anesthetic gases, with automatic agent identification. 18.5" capacitive color touchscreen, with approximately 360° rotation. Integrated breathing system, electronic PEEP, automatic pre-use system check, and anesthetic gas scavenging system. Electrical: 120 VAC, 60HZ, hospital grade connection, with rechargeable battery backup. 5-year warranty on parts and labor.	5
Nurse/Doctor Counter Printer	The patient document printer is used to generate and deliver clinical information such as medical orders,	Laser Printer w/Wireless Network and Duplex Printing	29

	results, labels, consents, and forms.		
Laptop Computer for Nursing	The nursing laptop is used to document care, access the patient's electronic record, record vital signs, administer medical orders, and facilitate communication with the healthcare team.	Intel Core Ultra 7 up to 3.8 Ghz GEN-16GB RAM DDDR5-512GB SSD M2-15.6" LCD FULL HD.	50
Counter Medical Desktop Computer	The desktop computer for physicians is used to consult and document clinical information, access the patient's electronic record, review results, order medications, and coordinate the care plan.	Gen Tower- Intel-Core i7-13700-16 Core- 5.2 Ghz 16 GB RAM 512 GB SSD - Slim DVD Rambo. Keyboard, Mouse, USB Optical Power. Aditional: Wireless Card tipe N and Monitor 12 Nagar 1 US Tiny-in-one 24 Gen5 Flat-23.8"	52
Pyxis Drug Systems First Floor (Ticu-N and OR Trauma)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory	Includes: The main double and single towers with all their drawers for organizing materials, the auxiliary double and single towers with their drawers, and the Medium Round Offset for all areas.	1

	control in clinical areas.		
Pyxis Drug Systems First Floor (Stabilizer)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory control in clinical areas.	Includes: The main double and single towers with all their drawers for organizing material, the auxiliary double and single towers with their drawers and the Med Round off set of all areas.	1
Pyxis Second Floor Medication System (Ticu-Sur)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory control in clinical areas.	Includes: The main double and single towers with all their drawers for organizing material, the auxiliary double and single towers with their drawers and the Med Round off set of all areas.	1
Pyxis Third Floor Medication System (Rehabilitation)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers	Includes: The main double and single towers with all their drawers for organizing material, the auxiliary double and single	1

	medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory control in clinical areas.	towers with their drawers and the Med Round off set of all areas.	
Pyxis Fourth Floor Medication System (Telemetry)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory control in clinical areas.	Includes: The main double and single towers with all their drawers for organizing material, the auxiliary double and single towers with their drawers and the Med Round off set of all areas.	1
Pyxis Medication System Fifth, Sixth and Seventh Floors (Intermediate Care)	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and	Includes: The main double and single towers with all their drawers for organizing materials, the auxiliary double and single towers with their drawers, and the Medium Round Offset for all areas.	3

	facilitates inventory control in clinical areas.		
Installation of the Pyxis Drug System	The PYXIS system is an automated electronic dispensing system that securely stores, controls, and delivers medications. It allows access with identification, reduces errors, improves traceability, records each withdrawal in real time, and facilitates inventory control in clinical areas	Installation and connection of the systems with the pharmacy central office.	1
Pixys Medical-Surgical Systems First Floor (Ticu-N)	PYXIS Medical-Surgical Supplies is an automated system that stores, controls, and dispenses supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas.	Includes: Main Stations, Double and Single Auxiliary Stations with Bio-ID and Scanner.	1
Pyxis Medical-Surgical Stabilizing	PYXIS Medical-Surgical Supplies is an	It includes: Main Stations, Auxiliary Stations, and the	1

System (Trauma and Corridor) and OR	automated system that stores, controls, and dispenses supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas.	rolling systems for the Intensive and Intermediate Care Units of the Hospital. It also includes the storage towers.	
Pyxis Medical-Surgical System Second Floor (Ticu-S)	PYXIS Medical-Surgical Supplies is an automated system that stores, controls, and dispenses supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas	Includes: Main Stations, 4 Double Auxiliary Stations, and the rolling systems for the Intensive and Intermediate Care Units of the Hospital. Also includes the storage towers.	1
Pyxis Medical-Surgical System Third Floor Rehabilitation	PYXIS Medical-Surgical Supplies is an automated system that stores, controls, and dispenses	Includes: Main Stations, Double and Single Auxiliary Stations with Bio-ID and Scanner.	1

	supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas

	sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas		
Installation of the Pyxis Medical-Surgical System and connection to the Hospital's inventory system	PYXIS Medical-Surgical Supplies is an automated system that stores, controls, and dispenses supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability, and facilitates inventory control in clinical areas.	Installation and connection of the systems with the hospital's inventory area.	1
IV Pump (Intravenous Infusion Machines)	An IV pump is an infusion pump that delivers fluids and medications precisely and in a controlled manner intravenously. It allows for adjustments to volume, rate, and time, reduces dosing errors, and maintains	Includes: Wireless Battery, one-screen barcode technology, author-reprogramming workflows, line check notification. Dose error reduction software, Time check alert and Keypad Lock.	332

	a constant flow, making it essential in hospital wards, emergency departments, and trauma centers.		
Transport Stretchers	Transport stretchers are used to move patients safely and stably within the hospital.	Hydraulic patient transport stretcher with integrated weighing scale, accuracy ≤ 0.5 kg and bed exit function. Safe working load: minimum 705 lb. Height approximately 55-89 cm (22-35in). Backrest adjustment 0-90° Trendelenburg/ reverse Trendelenburg ±18°. Four-section platform with adjustable things and calf sections. Retractable/folding side rails, minimum height approximately 36cm (14 in). 20cm (*in) casters with fifth steering caster for maneuverability. Integrated hydraulic controls, IV pole/push handles, and central braking system. Easy to clean construction suitable for hospital patient transport. 2-year warranty on parts and labor.	35

Fixed Physiological Monitors	Fixed physiological monitors are devices installed in clinical areas that record and display vital parameters in real time, such as heart rate, blood pressure, oxygen saturation, respiration, and temperature.	Multiparameter patient monitor for adult and pediatric patients. Minimum monitoring: 12-lead ECG, SPO_2, NIBP, temperature, respiration, $EtCO_2$, and invasive pressure. Minimum capacity of 8 waveforms and 24 parameters. 12" or large color touchscreen with clinical alarms and trend storage. Rechargeable battery system suitable for patient transport. Wireless and wired network connectivity for central monitoring. Includes all required patient cables, sensors, probes, cuffs, leads, power cables, and accessories for the specified monitoring parameters. Includes clinical software license, all required software, and necessary connectivity for integration with the hospital monitoring system. Includes bedside mounting plate/bracket and all required mounting hardware. Electrical: 120 VAC, 60Hz, hospital grade connection.	114

		5-year warranty on parts and labor.	
Nursing Monitoring Stations (Central Station 30 CH)	Central Station 30 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 30 patients channel simultaneously. Support for up to four high resolution touchscreen displays, with real time surveillance, waveforms, trends, and patient demographics. Integrated clinical access for review of retrospective patient data. Network access to hospital information systems and clinical data sources. Includes single user clinical software license and all required software for central monitoring. Includes 21.5" or large high-resolution touchscreen displays, as required for the configured system. Includes network laser printer for printing reports and patient monitoring data. Includes all required licenses, cables, network accessories, mounting hardware, and components for a	3 monitors per station (total 9) 3 printers

		complete operational system. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty on parts and labor.	
Nursing Monitoring Stations (Central Station 19 CH)	The Central Station 19 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 19 patients channel simultaneously. High resolution display with real time patient surveillance, waveforms, trends, and patient demographics. Clinical software for retrospective patient review. Network connectivity for integration with hospital information systems and central monitoring. Includes all required software licenses, cables, network, accessories, and components for a complete operational system. Includes high-resolution touchscreen display, minimum 21". Includes laser printer for reports and monitoring data. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty on parts and labor.	2 monitors 2 printers

Attachment F: Hospitaller and Medical Equipment

Nursing Monitoring Station 19 CH	The Central Station 19 CH is a fixed station where nursing staff can view, monitor, and analyze, in real time, the vital signs of up to 30 patients connected to monitors. It allows for the viewing of trends, alarms, and critical events, and facilitates continuous, centralized monitoring.	Central monitoring station capable of monitoring minimum 19 patients channel simultaneously. High resolution display with real time patient surveillance, waveforms, trends, and patient demographics. Clinical software for retrospective patient review. Network connectivity for integration with hospital information systems and central monitoring. Includes all required software licenses, cables, network, accessories, and components for a complete operational system. Includes high-resolution touchscreen display, minimum 21". Includes laser printer for reports and monitoring data. Electrical:120 VAC, 60Hz, hospital grade power connection. 5-year warranty required	2 monitors & 1 printer
Portable Physiological Monitors	Portable physiological monitors are devices that allow monitoring	4 complete Multiparameter patient monitor for adult and	4

	of vital parameters such as blood pressure, heart rate, oxygen saturation and respiration during the transport or transfer of patients.	pediatric patients. Minimum monitoring: 12-lead ECG, SPO_2, NIBP, temperature, respiration, $EtCO_2$, and invasive pressure. Minimum capacity of 8 waveforms and 24 parameters. 12" or large color touchscreen with clinical alarms and trend storage. Rechargeable battery system suitable for patient transport. Wireless and wired network connectivity for central monitoring. Includes all patient cables, ECG leads, SPO_2 sensors, Temperature probes, NIBP cuffs, $EtCO_2$ accessories, power cables, and accessories. Includes bedside mounting plate/bracket and all required mounting hardware for each monitor. Electrical: 120 VAC, 60Hz, hospital grade connection. 5-year warranty on parts and labor.	
Emergency Cart	The emergency cart is a mobile unit designed to respond quickly to cardiac	Tall Emergency Cart with MD30-EMG3 Emergency Package. M Series Cart - Standard width tall	23

	and respiratory emergencies.	cabinet with 30" of vertical drawer space, Breakaway lock, 6 drawers 3-3, 2-6, 1-9	
Portable Defibrillators	Mobile defibrillators are portable devices used to treat serious arrhythmias and cardiac arrest by delivering controlled electrical shocks. They are lightweight, easy to carry, battery-operated, and feature an ECG monitor, automatic or manual modes, and alarms.	ALS defibrillator with manual/AED defibrillation, synchronized cardioversion, and external pacing. Integrated 3/5-leand ECG, SpO_2, $EtCO_2$, NIBP, and CPR quality feedback. CPR quality feedback. CPR monitoring with compression rate/depth and artifact filtering. NIBP and SpO_2monitoring for adult and pediatric patients. Sidestream $EtCO_2$ monitoring for intubated and non-intubated patients. Includes required ECG, SpO_2, NIBP, $EtCO_2$, pacing cables/sensors and accessories Wi-Fi/USB connectivity, rechargeable battery, and data storage. Electrical: 120 VAC, 60 Hz. 5-year warranty on parts and labor.	21
Fixed Defibrillators	Fixed defibrillators are devices permanently installed in critical	Semi-automatic AED, English/Spanish language with voice and visual	3

	hospital areas to treat serious arrhythmia and cardiac arrest using controlled electrical shocks. They offer greater power, stability, and advanced features, including ECG monitoring, transcutaneous pacing, manual/automatic modes, and event logging.	prompts and integrated real-time CPR feedback. Rectilinear biphasic waveform with automatic adult energy selection of 120J, 150J, and 200J. CPR feedback for compression depth and rate, with a minimum recommended compression depth of 2 inches (5 cm). Adult CPR/defibrillation electrodes with integrated CPR sensor and minimum 5-year shelf life; pediatric capability with compatible pediatric electrodes. Includes 10 lithium batteries system with approximately 5-year standby life and capacity for extended operation. Includes wall-mounted metal cabinet with audible alarm and AED identification signage compliant with applicable Puerto Rico requirements. AED and accessories shall be supplied as a complete, ready-to-use system. 5-year warranty on parts and labor.	
Transport Monitors	Transport monitors are portable devices that allow monitoring of	High-acuity transport patients monitor for adult and pediatric patients. 8" or large touchscreen	39

	the patient's vital signs during transport within or outside the hospital.	display with visible alarm indicator. Supports minimum 11 clinical parameters, including 12-lead ECG, SpO_2, NIBP, temperature, respiration, and sidestream $EtCO_2$. Integrated rechargeable battery providing minimum 5 hours of continuous operation. Wireless Wi-Fi connectivity and compatibility with the hospital central monitoring system and electronic medical record. Storage of graphical and tabular trends and patient data. Compact, lightweight design with integrated carrying handle and mounting capability for IV pole or bed rail. Impact-resistant construction capable of withstanding a minimum 1- meter drop. Includes all required patient cables, sensors, probes, cuffs, and mounting hardware for a complete operational system. Electrical: 120VAC, 60Hz. 5-year warranty on parts and labor.	
Computer Tomography	The CT scanner uses X-rays and advanced computing to obtain detailed cross-sectional images of	Multi-slice CT System for full-body diagnostic imaging. High-performance X- ray generator and tube with	1

	the body. It allows for the visualization of organs, bones, and tissues with high precision, making it essential for diagnosing trauma, bleeding, fractures, internal injuries, and complex pathologies.	advance thermal management. Solid-state detector with high spatial resolution and extended coverage. Gantry aperture ≥ 70cm. Gantry rotation time ≤ 0.35 seconds. High-pitch helical acquisition capability. Motorized patient table with minimum load capacity of 500 lb. Automatic patient positioning with laser alignment system. Dose reduction technologies including automatic tube current modulation. Iterative reconstruction and AI-based image reconstruction. ECG-gated acquisition for cardiac imaging. High-speed acquisition and reconstruction for emergency and routine use. GPU-accelerated reconstruction system. Advance workstation with MPR, 3D and volumetric analysis tools. Full DICOM compliance with PACS/RIS integration. Patient communication system(audio/Visual) Integrated operator	

		console for acquisition and post-processing. Electrical compatibility with site configuration 480V/208 V, (3-phase power) UPS compatibility with minimum 7-10 minutes autonomy. Designed for continuous high-volume hospital operations. 5-year warranty on parts and labor.	
Fixed X-Ray Machine	A fixed X-ray machine is a permanently installed piece of equipment used to obtain radiographic images of the body using X-rays. It produces rapid studies of bones, the chest, and internal structures, essential for diagnosing fractures, traumatic injuries, infections, and acute conditions.	Ceiling-Mounted digital radiography system for general, trauma, pediatric, INCU, chest, spine, and full-body examinations. X-ray generator: minimum 150kW and 65kW. Digital Flat-panel detector: 35x43 cm (14"x 17") pixel size ≤160µm. Motorized height-adjustable table with minimum 825 lb patient capacity. Motorized ceiling tube suspension with integrated collimation, positioning controls, and live positioning camera. Automatic Exposure control with manual and automatic exposure techniques. Advanced image processing, dose	1

		optimization, and stitching for full-spine/full-leg imaging. Operator workstation with 21" or large color display, image acquisition, processing, storage, and review. DICOM connectivity for PACS/RIS and hospital network integration. Includes complete installation, calibration, testing, commissioning, software, detector, accessories, and required system components. 480V/208 V, (3-phase power) UPS compatibility with minimum 7-10 minutes autonomy. Designed for continuous high-volume hospital operations. 5-year warranty on parts and labor.	
Portable X-Ray Machine	The portable X-ray machine is a mobile device that allows X-rays to be taken directly at the patient's bedside.	Mobile digital X-ray system for bedside, ICU, emergency, Trauma, OR and general radiography. Generator with 10-500 mA, 0.1-500 mAs, and exposure times of 0.001-1.25 seconds. Wireless digital flat-panel detector, suitable for general radiography. 21.5" or larger color	1

		display with DICOM-compatible image acquisition and review. Motorized drive system with precise tube positioning and compact maneuverability. Rechargeable lithium-ion battery, providing minimum 8 hours of operation/ mobility and rapid charging. Advanced image processing with scatter correction and nose/artifact reduction. Wireless connectivity and DICOM/ PACS integration. Includes all required detector, cables, batteries, chargers, software, accessories, installation, calibration, and commissioning. Electrical 120VAC, 60 Hz. 5-year warranty on parts and labor.	
Intermediate beds	Intermediate care beds are used for patients requiring continuous monitoring, but not at the level of intensive care. They allow for basic and advanced monitoring, have safety rails, height	Electrical critical care bed with integrated patient weighing system, accuracy ≤0.5 Kg. Safe working load: minimum (550 lb.) patient capacity. Electrical height adjustment approximately 16-32in. Motorized Trendelenburg/Reverse	85

	and position adjustments, and facilitate the care of stable patients at moderate risk.	Trendelenburg ±14°, backrest and thing adjustment. Adjustable split side rails, bed extension, and patient positioning functions. Integrated patient controls, caregiver controls, and bed-exit/position safety features. Heavy-duty casters with central braking system and fifth steering wheel/caster for enhanced maneuverability and directional control. Easy-to-clean, corrosion-resistant construction suitable for critical care. Includes integrated scale, mattress platform, all required controls, cables, battery, accessories, and mounting components. Electrical 120 VAC, 50/60 Hz. 3-year warranty on parts and labor.	
Intensive Care Beds	Intensive care beds are designed for critically ill patients requiring continuous monitoring and advanced support. They offer multiple positions, electric adjustments, secure	Electric critical care bed with automatic lateral tilt/ therapy up to ±30° and programmable lateral therapy. Minimum safe working load: 550lb. 8" or large touchscreen with integrated patient/caregiver	38

	side rails, integrated weighing, compatibility with monitoring equipment, and easy access for procedures.	controls. Electric positioning including Trendelenburg/ reverse Trendelenburg, vascular position, and one-touch full chair position. Electronic and manual CPR, electronic braking system, and multi-zone bed-exit alarm. C-arm compatible radiolucent mattress platform for bedside imaging. Integrated sit-to-stand mobilization system and foot-pedal controls. Fifth steering caster for enhanced maneuverability and central braking system. Dual accessory outlets: 120 VAC. Includes required battery, cables, controls, accessories, and mounting components. Electrical 120 VAC, 50/60 Hz. 3-year warranty on parts and labor.	
Ventilator	Mechanical ventilators are devices that assist or replace the patient's breathing, administering air and oxygen with controlled volume,	ICU ventilator for adult and pediatric patients with advanced invasive, non-invasive, and high-flow oxygen therapies. Advance ventilation modes including ASV, pressure/volume control, SIMV, APRV, NIV, and	43

	pressure, and frequency.	high-flow o_2. Tidal volume range of 20-2,000 ml and high inspiration flow capability. 17" or large detachable touchscreens with real-time waveforms, loops, trends, alarms, and advance lung mechanics monitoring. Integrated humidification system with H 900- equivalent humidifier, including required support and controls. Integrated turbine, leak compensation, oxygen monitoring, and automatic pre-use checks. Rechargeable battery system providing minimum 1.5 hours operation, expandable to approximately 3 hours with additional battery. Includes trolley, power cord, oxygen DISS connector, tubing support arm, communication interfaces, sensors, cables, and all required accessories. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
MRI Ventilator Fans	MRI-compatible ventilators are devices designed to	High acuity ventilator for adult, pediatric, and Neonatal patients,	2

	operate safely within the magnetic resonance imaging (MRI) environment, where extremely strong magnetic fields are present. They are constructed from non-ferromagnetic materials, use remote control systems, and enable advanced ventilation modes for critically ill patients requiring respiratory support during MRI scans.	suitable for intrahospital transport and MRI procedures. MR conditional for 1.5 T and 3.0 T MRI systems, with integrated magnetic field monitoring and safety alarms. Advanced ventilation including volume/pressure control, ASV, DuoPAP/APRV, NIV/NIV-ST, and high-flow o_2. Integrated turbine with no compressed air requirement and automatic leak compensation. 8" or large color display with waveforms, loops, trends, monitoring, and alarms. Rechargeable lithium-ion battery providing minimum 3 hours continuous operation; extended operation with additional battery capacity. Includes trolley, oxygen hose, high pressure O, connector, power cord, batteries, expiratory valve, HEPA/dust filters, oxygen cell, breathing circuit support, and required software and all accessories. Electrical 120 VAC, 60 Hz. 2-year	

Attachment F: Hospitaller and Medical Equipment

		warranty on parts and labor.	
IV Stand	The IV stand is a mobile stand with hooks that allows you to hang bags of intravenous fluids and medications to ensure adequate flow to the patient. It is height-adjustable, lightweight, stable, and easy to move.	Five Legs 25" 4 Hook Top	99
Examination Lamps	Medical examination lamps provide focused, clear, and shadow-free illumination for patient evaluation during clinical procedures. They are adjustable, portable, or fixed, with high-quality LED light, low heat generation, and excellent precision for examinations.	With Mobile Stand White Led 20,000 Lux Touchless Control	51
May	A small, height-adjustable table that is placed nearby to keep sterile instruments and materials within immediate reach of the doctor or nurse.		53
Medical Surgical Roller	The surgical roller is a mobile cart used to	Main Single Scanner - System for distributing	24

	transport sterile instruments, equipment, and materials within the surgical area. It is lightweight, easy to move, has smooth, durable surfaces, and helps organize and streamline workflow in surgery and trauma care.	medical and surgical materials to different areas (mobile). They are part of the central Pyxis system.	
Medication carts with nurse monitor	Nursing medication carts are mobile units organized into drawers and compartments that allow for the safe storage, preparation, and transport of medications.	Include: Monitor touchscreen display, Keyboard, 8 bin 4", 5" caster with lock, electronic access in all drawers with automatic relocking.	16
Multi-parameter beds with lateral rotation	Multiparameter beds with side rotation are designed for critically ill patients requiring continuous, effortless mobilization. They feature automatic side turns, help prevent pressure ulcers, improve pulmonary ventilation, reduce respiratory complications, and facilitate patient care.	Advance electric ICU bed with minimum 650 lb safe working load. Powered therapeutic surface with pressure redistribution, microclimate management, and pulmonary therapy. Integrated continuous lateral rotation and percussion vibration therapy. Full electric positioning including Trendelenburg, reverse Trendelenburg, cardiac chair, and sit-to-stand. Automatic lateral	3

		positioning, head of bed angle monitoring, and 3 mode bed exit alarm. C-arm compatible radiolucent sleep deck with unrestricted imaging access. Early mobility system with assisted sit to stand and patient mobilization. Powered transport system with fifth wheel steering and central braking. Integrated patient caregiver controls with battery backup and accessory outlets. Includes mattress surface, battery, cables, controls, IV pole accessories, and all components required for full ICU configuration. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
Enteral Feeding Machine	An enteral feeding machine is a device that delivers liquid nutrition in a controlled manner through feeding tubes (nasogastric, gastrostomy, or jejunostomy). It regulates rate and volume, ensures a safe and continuous	Volumetric enteral feeding pump for continuous and intermittent feeding, hydration, and thick formulas. Feed rate: 1-400mL/he, think formula: 1-200mL/hr, programmable feed and flush volumes. Automatic Feed & Flush with programmable intervals	43

	supply, prevents flow variations, and is essential for patients who cannot feed orally.	and auto-priming. Accuracy of ±5% or better with standard formula. Compatible with think, homogenized and blenderzed formulas, including IDDSI levels 2-4. Attitude independent operation with no drip chamber 20-hour minimum battery life and rechargeable battery. 30 days feeding and flushing history, with interruption monitoring and audible and visual alarms. IPX6 Water resistant design, suitable for cleaning under running water. Includes pole clamp, AC power adapter, rechargeable battery, feeding sets with ENFit™ connections, and all required accessories for operation. Electrical 120 VAC, 60 Hz. 1-year warranty on parts and labor.	
Warming Unit for Blanket	Patient warming machines are devices that deliver controlled warm air to special heated blankets to maintain or raise a patient's body temperature. They	Force-air patient warming unit for adult and pediatric patients, with rolling cart. Four temperature settings: ambient, 32°C, 38°C, and 43°C, with temperature accuracy of ±3°. Airflow	53

	help prevent hypothermia, improve hemodynamic stability, and reduce complications during surgery, trauma, and recovery.	up to 44 CFM (20.8 L/S) with quiet operation, approximately 50dBA. Audible and visual alarms for over temperature, and system faults. Detachable flexible hose, filter-change indicator, and MERV 14 filtration. Compatible with force-air warming blankets and gowns; suitable for surgical and clinical environments. Includes rolling cart, hose, power cord, filter, temperature test accessory, and required mounting and accessories. Electrical 120 VAC, 60 Hz. Complies with applicable IEC 60601-1 electrical safety requirements and IPX1 protection. 1-year warranty on parts and labor.	
Night table	The patient bedside table is a compact piece of furniture located next to the hospital bed that allows for the storage of personal items, basic medical equipment, and	Bedside Cabinet	148

	frequently used materials.		
Dining tables	The patient's dining table is an adjustable and mobile table that is placed over the hospital bed to facilitate meals, reading, and basic activities.	Overbed table	148
Wardrobe	The patient wardrobe is a piece of furniture located in the hospital room that allows the patient to store clothing, personal items, and essential belongings in an organized and secure manner.	Closet with two doors Black-Brown	138
Patient seat	The patient chair is a comfortable, sturdy, and stable chair designed to seat the patient safely during assessments, therapies, or rest out of bed.	Fold down, flush mount side tables, Soft, wide armrest, tente casters, removable side panel, rear push handle, integrated leg and footrest	148
Family seat	The patient family member chair is a comfortable and sturdy chair located in the hospital room to allow the family member to accompany, support,	Steel and Wood Construction, Multiple Positions, Open Design and Caster Wheels	148

	and remain close to the patient.		
TV with wall mount	The patient wall-mount television is a device installed on the wall of the hospital room to provide entertainment, information, and comfort during the stay.	32", Full Led HD Smart Tizen TV with Sanus Elite Wall Mount	138
Whiteboard for patient notes	The patient note board is a tool placed in the hospital room to communicate essential information, such as the patient's name, medical team, daily schedule, times, and reminders. It facilitates communication between staff, the patient, and family, improves organization, and contributes to patient safety.	3M - Porcelain Magnetic Dry-erase White Board 96" x 48" aluminum frame with silver finish	10
Automated device for delivering compressions	The Mechanical CPR is an automated device that performs continuous, high-quality mechanical chest compressions during cardiopulmonary	Automated mechanical CPR system for adult patients, providing patient-customized circumferential chest compressions. Compression rate: 80 ±5 compressions/min, with	32

	resuscitation (CPR). It maintains ideal rhythm, depth, and rate, reduces staff fatigue, allows CPR to continue during patient transfers or procedures, and improves safety and effectiveness in cardiac arrest, emergency, and trauma situations.	30:2 and continuous compression modes. Automatic patient sizing for chest circumferences of 30-56in (76-142 cm) and patient weight up to 400lb. Chest compression depth equivalent to approximately 20% reduction in anterior-posterior chest depth. Radiolucent platform suitable for imagining and fluoroscopy during CPR. Dual-sided control panels for operation in confined spaces and during patient transport. Rechargeable Li-ion battery system, including spare battery and dual-bay charger. Includes platform, compression band, batteries, charger, and all required accessories for operation. USB data transfer and performance report capability. IP44 or higher protection and compliance with applicable IEC 60601-1 requirements. 3-year warranty on parts and labor.	

Patient Label Printers	Patient label printers generate identification labels for wristbands, lab samples, medications, and clinical documents. They ensure accuracy, legibility, and traceability, reduce identification errors, and integrate with the hospital system to print data automatically and in real time.	Thermal Desktop Printer	10
Negative pressure wound therapy system (vac)	The VAC system is a device that applies controlled negative pressure to a wound to improve healing, reduce edema, increase perfusion, and remove exudate. It uses a special sponge, an airtight seal, and a vacuum pump that maintains constant suction. It is essential for complex, traumatic, surgical, and chronic wounds, accelerating recovery and reducing the risk of infection.	Active fluid elimination and edema reduction.	12

Vital Signs Monitor with Cart	The vital signs monitor with cart is a portable device mounted on a mobile base that allows for the monitoring of vital parameters such as blood pressure, pulse, oxygen saturation, temperature, and respiration. The cart facilitates mobility, stability, and quick access, enabling its use in emergency, hospital, trauma, and procedures where continuous monitoring and easy transport of the equipment are required.	Vital Signs monitor with SpO_2, NIBP, pulse rate, and predictive oral temperature. 8" color capacitive touchscreen, with hard keys, control knob, and 360° visual alarm indicator. NIBP with manual, automatic, and continuous measurement modes. SpO_2monitoring with reusable adult sensor and extension cable. Predictive temperature measurement with accuracy ±0.1°C or better. Rechargeable lithium-ion battery with minimum 3.5 hours of operation. Built-in Wi-Fi, USB, network connectivity, and nurse-call interface for clinical data integration. Includes rolling stand with mounting plate, adult SpO_2 sensor, NIBP cuff and tubing, temperature probe/accessories, battery, power cord, and all required cables. Electrical: 120 VAC, 50/60 Hz operation. 3-year warranty on parts and labor.	48

Fetal and Maternal Monitor	The fetal and maternal monitor is a device that records fetal heart rate, uterine contractions, and maternal signs such as pulse and blood pressure.	Fetal and Maternal monitor with dual FHR monitoring for twin pregnancies. Monitoring of FHR, TOCO, fetal movement, maternal ECG/HR, SpO_2, NIBP, and temperature, Supports DECG and IUP monitoring for advanced labor assessment. 12.1" color touchscreen with simultaneous wave form and numeric display. Integrated thermal recorder with selectable speeds of 1, 2, and 3 cm/min, and 25mm/sec for ECG/history data. Internal rechargeable Li-ion battery, minimum 14.8 V/ 4.4 Ah. USB and RS-232 connectivity with clinical data/software capability. Includes twin FHR/TOCO transducer, maternal SpO_2 Sensor, NIBP cuff and tubing, temperature accessories, ECG cables, DECG/IUP accessories, printer supplies, battery, power cord, and all required accessories. Includes rolling stand and /or wall-mount configuration. Electrical 120 VAC, 60 Hz. 2-year	1

		warranty on parts and labor.	
Intraosseous	The intraosseous system is a device used to quickly access the inside of the bone and administer medications, fluids, and blood when an intravenous line cannot be obtained.		4
MRI-compatible intravenous infusion pump	The MRI-compatible intravenous infusion pump is a device designed to operate safely within the magnetic resonance imaging (MRI) environment, where magnetic fields are very strong. Constructed from non-ferromagnetic materials, it does not interfere with the image and maintains precise and continuous infusions during MRI scans of critically ill patients.	Non-magnetic IV infusion system specifically designed for use during MRI procedures from 0.2T to 3.0T, operational up to 10,000 gauss. Infusion rate range: 0.1-1,400mL/hr, suitable for neonatal, pediatric, and adult patients. Non-magnetic ultrasonic motor with accurate fluid delivery and dose-rate calculator and programmable bolus. Integrated safety features including inlet/outlet occlusion detection, and free-flow prevention. Rechargeable lithium battery providing approximately 12 hours of operation. Numeric keypad with audible and visual alarms and infusion	2

		status indicators. Includes non-magnetic mobile IV pole, battery, charger, power cord, and MRI compatible disposable IV tubing sets. System shall be latex-free and DEHP-free. Electrical 120 VAC, 60 Hz. 1-year warranty on parts and labor.	
MRI Compatible Cardiac Monitor	The MRI-compatible cardiac monitor is a device designed to operate safely within the magnetic resonance imaging environment, where very strong magnetic fields exist. It is constructed of non-ferromagnetic materials, does not interfere with the images, and allows for the recording of ECG, heart rate, respiration, and oxygen saturation during the scan.	Portable, non-magnetic patient monitor specifically designed for MRI Zone IV, operating safely in magnetic fields up to 30,000 gauss. Continuous monitoring of ECG, SpO_2, NIBP, $EtCO_2$, temperature, and invasive blood pressure (IBP). Wireless ECG with dynamic gradient filtering and wireless patient parameter modules. 360° visual severity-based alarms. High-resolution touchscreen display with real-time waveforms, trends, alarms, and patient data. Extended-range wireless communication between the patient monitor and MRI control room. Rechargeable battery system with integrated	2

		charging for monitor and wireless modules. Compatible with remote control/ viewing station for monitoring inside MRI Zones III and IV. HL7 and RS-232 connectivity for EMR/clinical information system integration. Includes all required ECG, SpO_2, NIBP, $EtCO_2$, cables, sensors, modules, batteries, chargers, mounting hardware, and accessories. Includes non-magnetic mounting/roll stand suitable for MRI-ready and fully operational, including installation, configuration, testing, and user training. Electrical 120 VAC, 60 Hz. 2-year warranty on parts and labor.	
Hemodynamic Monitors	Hemodynamic monitors are advanced devices that assess the cardiovascular status of critically ill patients in real time. They measure parameters such as invasive blood pressure, cardiac output, venous oxygen	Non-invasive continuous hemodynamic monitoring using bioreactance technology. Measure displays Cardiac output (CO_2), Stroke Volume (SV), Stroke Volume Index (SVI), and Total peripheral Resistance (TPR). Provides dynamic fluid-responsiveness assessment using Passive	4

	saturation, central venous pressure, and other variables that allow for the determination of cardiac perfusion and function.	Leg Raise (PLR) and fluid bolus testing. NIBP and SpO_2 monitoring integrated. Real-time monitoring with trends and hemodynamic assessment reports. Patient sensors positioned on the chest/back; minimum 25 disposable sensors included. Passive Leg Raise lift capable of positioning the patient's legs at approximately 45°. Includes patient cable, NIBP cuff and tubing, SpO_2 accessories, power cord cable, rechargeable battery, and all required cables and accessories. Includes rolling stand with five caster wheels and locking brakes. Compatible with connectivity to external patient monitors through appropriate interfaces. Including installation, calibration, and user training. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
ECMO	ECMO (Extracorporeal Membrane		2

	Oxygenation) is an advanced life support system that oxygenates the blood and partially replaces the function of the heart and/or lungs. It removes blood from the patient, oxygenates it using an artificial membrane, and returns it to the body. It is used in severe respiratory failure, cardiogenic shock, cardiac arrest, and severe trauma, providing time for recovery while maintaining perfusion and oxygenation.		
Equipment for high-frequency oscillation of the chest wall (Oxilator)	The high-frequency chest wall oxystrator is a device that applies rapid vibrations and external compressions to the chest to help loosen and mobilize pulmonary secretions. It uses a pneumatic vest connected to a machine that generates high-frequency air pulses. It is essential for patients with thick mucus, lung diseases, chest	High-frequency oscillatory (HFOV) for adult and pediatric patients, including patients ≤35 Kg. Active inspiration and active expiration for lung-protective ventilation. Adjustable frequency: 3-15 Hz (180-900 breaths/min) Adjustable mean airway pressure, oscillatory amplitude/ power, inspiratory time and bias flow. Continuous airway-pressure monitoring with audible	4

	trauma, and difficulty expectorating, improving ventilation and airway clearance.	and of visual alarm for pressure, gas supply, power and system faults. Dedicated patient circuits available for adult and pediatric patients, including appropriate circuit configurations for different patient weights. Complete heated humidification system, including humidifier, chamber, temperature probe and mounting hardware. Include air/O_2 bender, medical air and oxygen hoses with DISS connections. Includes complete patient circuits, circuit support arm/cradle, water trap, filters and all required pressure-sensing components. Includes rolling base cart and all required mounting accessories. Includes power cord, gas hose, initial patient circuits, filters and consumables required for initial operation. Medical air and oxygen supply compatible with hospital DISS outlets. Electrical: 120 VAC, 60Hz, hospital grade power connection.	

		Includes installation, calibration, preventive maintenance documentation, operational testing and user training. 1-year warranty on parts and labor.	
Thromboelastogram	A thromboelastogram is a test that evaluates the entire coagulation process in real time: how a clot forms, strengthens, and dissolves. It analyzes the function of platelets, fibrinogen, coagulation factors, and fibrinolysis, providing a comprehensive view of hemostatic status. It is essential in trauma, major surgery, massive bleeding, and anticoagulation management, helping to make accurate decisions about transfusions.	Automated viscoelastic whole-blood hemostasis analyzer using single-use microfluidic cartridges. Ability to perform up to four assays simultaneously without manual reagent mixing or pipetting. Provides comprehensive assessment of clot strength, fibrin contribution, clot stability/lysis, and platelet function. Supports global hemostasis and platelet function testing, including ADP and AA platelet response. Results available rapidly, with automated analysis and graphical/numerical results. Integrated quality control and self-monitoring functions. Touchscreen interface with patient identification, test status, results and graphical interpretation.	2

		Ability to store and retrieve patient results and graphical interpretation. Ability to store and retrieve patient results and connect to hospital network/software for remote results viewing and data management. Compatible with barcode scanner and USB printer. Includes analyzer, power supply, required cables, barcode scanner, printer, and initial supply of hemostasis and platelet-function cartridges, including QC materials. Electrical: 120 VAC, 60Hz. Includes installation, configuration, calibration, verification, user training and documentation. 1-year warranty on parts and labor.	
Machine for heating fluids and blood (Ranger)	The Ranger is a system that warms intravenous fluids and blood to a safe temperature before administering them to the patient. It uses a rapid and controlled heating mechanism, preventing hypothermia associated with	Blood and fluid warming system using dry-heat technology, without water reservoir Designed to warm blood products, and IV fluids during administration. Adjustable flow capability from KVO to 500mL/min, with pediatric, standard, and high-flow disposable sets.	5

	transfusions or massive infusions.	Fluid output temperature maintained approximately 33-41 °C, with 41°C set point and warm-up time of less than 2 minutes. Audible and visual alarms for over-temperature and system faults, with automatic temperature monitoring and safety cutoff. Sterile, single-use warming sets, latex-free and DEHP-free, capable of handling pressure up to 300 mmHg. Includes warming unit, IV-pole mounting capability, power cord, cleaning tool, temperature verification accessory, and initial warming sets for pediatric, standard, and high-flow applications. Electrical: 120 VAC, 60Hz, maximum heating power approximately 900W. Compliable with applicable IEC/EN 60601-1 medical electric safety requirements. 1-year warranty on parts and labor.	
Electrocautery	Electrocautery is a surgical device that uses electrical energy	Advanced electrosurgical energy platform for monopolar, bipolar, vessel	5

	to cut tissues and control bleeding through coagulation.	sealing, and bipolar resection. 7" or large color touchscreen with intuitive controls, procedure information, instrument recognition, and system status. Monopolar modes for cut and coagulation. Bipolar modes for cut and coagulation, including bipolar resection. Advance bipolar vessel sealing technology for sealing and dividing vessels and tissue bundles according to the validated specifications of the proposed instruments. Automatic tissue sensing and energy modulation to optimize energy delivery according to tissue characteristics and provide constituent sealing performance. Return- electrode monitoring with automatic interruption of energy delivery when unsafe conditions are detected. Audible and visual alarms for system faults, improper connections, instrument incompatibility, and	

		safety conditions. Multiple connections for monopolar and bipolar instruments. Includes monopolar, footswitch, bipolar/resection footswitch, universal mounting/ transport cart, power cord, required cables, accessories necessary for complete operation. Electrical: 120 VAC, 60Hz. Maximum power consumption approximately 950VA. Compliance with applicable IEC 60601-1 and IEC 60601-2-2 standards, Includes installation, operational verification, user training, and technical support. 1-year warranty on parts and labor.	
QNRG+ Metabolic Monitor Calorimeter	The QNRG+ is a metabolic monitor that measures the patient's actual energy expenditure using indirect calorimetry.	Indirect calorimetry system for measurement of Resting Energy Expenditure (REE) in mechanically ventilated and spontaneously breathing patients. Measures VO_2, VCO_2, Respiratory Quotient (RQ), REE/RMR, and substrate utilization (%fat, % carbohydrate, % protein).	4

		Measurement range: VO_2 and VCO_2 10-1,000mL/min. REE range: 0-7,200 Kcal/day. Accuracy: VO_2/VCO_2±3% or 5mL/min; REE± or 36 Kcal/day. Integrates O_2 and CO_2 gas analyzers with automatic calibration. Ventilator mode with disposable flow measure and compatibility with mechanical ventilators. Capable of testing with canopy hood and face mask for spontaneously breathing patients. 10" or large color capacitive touchscreen with real-time metabolic data and graphical display. Internal rechargeable Li-ion battery, minimum 3 Hours operation. Data export formats: USB, PDF, CSV and XML. Includes metabolic monitor, rolling cart with cylinder holder, power cable, USB cable, required tubing/adapters and accessories. Includes certified calibration gas: 16% O_2, 5% CO_2, balance N_2, with regulator/cylinder connection as required. Includes required single-

		use flow measurement and gas sampling components for initial operation. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
Ice Machines	Ice machines in hospitals produce clean, safe ice for clinical and operational use. They are used for cold therapy in injuries, managing inflammation and pain, preparing cold packs, temporarily preserving specimens, and supporting procedures that require controlled cooling.		7
IV Pole Treatment Chairs	IV pole treatment chairs are comfortable, reclining chairs designed for patients receiving intravenous therapies, such as hydration and medication.	pound weight capacity Clinical Care Recliner, Fold down, flush mount side tables, Soft, wide armrest, tente casters, removable side panel, rear push handle, integrated leg and footrest	16
Gradual compression pumps for anti-embolism stockings	Graduated compression pumps are devices that apply sequential and	Sequential pneumatic compression system for DVT prophylaxis. Patient detection to verify proper	143

	automatic pressure to the legs using special stockings or sleeves. Their purpose is to improve venous return and prevent deep vein thrombosis.	garment application and therapy. Vascular refl detection (VRD) with automatic adjustment of compression cycle. Graduated sequential compression for thing, calf, and foot therapy Unilateral or bilateral therapy. LCD display with audible/visual alarms. Rechargeable battery with minimum 8 hours operation. Includes controller, tubing, battery/ charger, power cord, and required compression garments battery, charge, power cord and all required accessories. Electrical: 120 VAC, 60Hz. 1-year warranty on parts and labor.	
Portable Bronchoscope	It is used to assess and manage the airway in trauma situations, especially when there is a difficult airway, suspected tracheobronchial injury, or internal bleeding.		1
PCA Pumps	They are used for acute pain when continuous and safe analgesia is required.		4

Attachment F: Hospitaller and Medical Equipment

BIS Monitors	It estimates the level of sedation/anesthesia by analyzing brain electrical activity using EEG.		1
CRRT Machine	It is a machine for continuous renal replacement therapy used in critically ill patients with acute kidney failure, especially when they are hemodynamically unstable and cannot tolerate intermittent hemodialysis.		10
C Arm	It is a mobile fluoroscopy unit used to obtain real-time radiographic images during surgical or interventional procedures.		2
I-Stat Laboratory	The I-STAT is a portable point-of-care (POC) analyzer that provides rapid results in minutes from blood samples without sending them to a laboratory. It uses disposable cartridges specific to each type of test (arterial blood gases, electrolytes, BUN, creatinine,		4

	lactate, troponin, coagulation, etc.).

(Rolling system is included in the Roller section).	3
Installation of the Pyxis Medical-Surgical System and connection to the Hospital's inventory system	PYXIS Medical-Surgical Supplies is an automated system that stores, controls, and dispenses supplies such as gauze, sutures, instruments, and sterile devices. It uses identification-based access, records each withdrawal in real time, reduces losses, improves traceability,	Installation and connection of the systems with the hospital's inventory area.	1

	and facilitates inventory control in clinical areas.		
Emergency Cart	The emergency cart is a mobile unit designed to respond quickly to cardiac and respiratory emergencies.	Tall Emergency Cart with MD30-EMG3 Emergency Package. M Series Cart - Standard width tall cabinet with 30" of vertical drawer space, Breakaway lock, 6 drawers 3-3, 2-6, 1-9	23
IV Stand	The IV stand is a mobile stand with hooks that allow you to hang bags of intravenous fluids and medications to ensure adequate flow to the patient. It is height-adjustable, lightweight, stable, and easy to move.	Five Legs 25" 4 Hook Top	99
Examination Lamps	Medical examination lamps provide focused, clear, and shadow-free illumination for patient evaluation during clinical procedures. They are adjustable, portable, or fixed, with high-quality LED light, low heat generation, and excellent precision for examinations.	With Mobile Stand White Led 20,000 Lux Touchless Control	51

May	A small, height-adjustable table that is placed nearby to keep sterile instruments and materials within immediate reach of the doctor or nurse.		53
Medical Surgical Roller	The surgical roller is a mobile cart used to transport sterile instruments, equipment, and materials within the surgical area. It is lightweight, easy to move, has smooth, durable surfaces, and helps organize and streamline workflow in surgery and trauma care.	Main Single Scanner - System for distributing medical and surgical materials to different areas (mobile). They are part of the central Pyxis system.	24
Medication carts with nurse monitor	Nursing medication carts are mobile units organized into drawers and compartments that allow for the safe storage, preparation, and transport of medications.	Include: Monitor touchscreen display, Keyboard, 8 bin 4", 5" caster with lock, electronic access in all drawers with automatic relocking.	16
Night table	The patient bedside table is a compact piece of furniture located next to the hospital bed that allows for the storage of personal items,	Bedside Cabinet	148

	basic medical equipment, and frequently used materials.		
Dining tables	The patient's dining table is an adjustable and mobile table that is placed over the hospital bed to facilitate meals, reading, and basic activities.	Overbed table	148
Wardrobe	The patient wardrobe is a piece of furniture located in the hospital room that allows the patient to store clothing, personal items, and essential belongings in an organized and secure manner.	Closet with two doors Black-Brown	138
Patient seat	The patient chair is a comfortable, sturdy, and stable chair designed to seat the patient safely during assessments, therapies, or rest out of bed.	Fold down, flush mount side tables, Soft, wide armrest, tente casters, removable side panel, rear push handle, integrated leg and footrest	148
Family seat	The patient family member chair is a comfortable and sturdy chair located in the hospital room to allow the family member to	Steel and Wood Construction, Multiple Positions, Open Design and Caster Wheels	148

	accompany, support, and remain close to the patient.		
TV with wall mount	The patient wall-mount television is a device installed on the wall of the hospital room to provide entertainment, information, and comfort during the stay.	32", Full Led HD Smart Tizen TV with Sanus Elite Wall Mount	138
Whiteboard for patient notes	The patient note board is a tool placed in the hospital room to communicate essential information, such as the patient's name, medical team, daily schedule, times, and reminders. It facilitates communication between staff, the patient, and family, improves organization, and contributes to patient safety.	3M - Porcelain Magnetic Dry-erase White Board 96" x 48" aluminum frame with silver finish	10
Patient Label Printers	Patient label printers generate identification labels for wristbands, lab samples, medications, and clinical documents. They	Thermal Desktop Printer	10

	ensure accuracy, legibility, and traceability, reduce identification errors, and integrate with the hospital system to print data automatically and in real time.		
Negative pressure wound therapy system (vac)	The VAC system is a device that applies controlled negative pressure to a wound to improve healing, reduce edema, increase perfusion, and remove exudate. It uses a special sponge, an airtight seal, and a vacuum pump that maintains constant suction. It is essential for complex, traumatic, surgical, and chronic wounds, accelerating recovery and reducing the risk of infection.	Active fluid elimination and edema reduction.	12
Intraosseous	The intraosseous system is a device used to quickly access the inside of the bone and administer medications, fluids, and blood when an		4

	intravenous line cannot be obtained.		
Ice Machines	Ice machines in hospitals produce clean, safe ice for clinical and operational use. They are used for cold therapy in injuries, managing inflammation and pain, preparing cold packs, temporarily preserving specimens, and supporting procedures that require controlled cooling.		7
IV Pole Treatment Chairs	IV pole treatment chairs are comfortable, reclining chairs designed for patients receiving intravenous therapies, such as hydration and medication.	pound weight capacity Clinical Care Recliner, Fold down, flush mount side tables, Soft, wide armrest, tente casters, removable side panel, rear push handle, integrated leg and footrest	16

Table B: Hospitaller Equipment

GENERAL CONDITIONS FOR HOSPITALLER EQUIPMENT

This section applies to all hospitaller equipment included in this RFP, such as hospital beds, chairs, IV stands, cabinets, wardrobes, and similar furnishings. All conditions set forth herein form an integral part of the proposal.

1. Warranty Requirements

a. Mandatory Minimum Warranty

The Contractor shall provide a minimum one (1) year warranty against manufacturing defects for all equipment offered. The warranty must include repair or replacement at no cost to the institution.

b. Mandatory Warranty Coverage

The warranty must cover, at a minimum: (1) Structural defects in the equipment; (2) Failures in wheels, brakes, bases, or mobility systems; (3) Problems with adjustment mechanisms or height; and (4) Imperfections in materials, welds, joints, or finishes resulting from the manufacturing process.

c. Permitted Exclusions Warranty exclusions are limited to: (1) Damage due to misuse or negligence by the user; (2) Technical interventions performed by unauthorized third parties; and (3) Normal wear and tear from continuous use. No additional exclusions will be accepted without technical justification.

d. Warranty Certificate

The contractor shall include in their proposal a copy of the official warranty certificate, clearly indicating the duration, coverage, and claims procedure.

2. Supplier Responsibilities

a. Delivery and Installation The selected supplier must: (1) Deliver all equipment in optimal condition; (2) Perform installation and assembly when applicable; and (3) Provide user and maintenance manuals.

b. Technical Service During the Warranty Period The supplier must offer: (1) Free diagnostics; (2) Repair or replacement of defective parts; and (3) Labor included.

c. Response and Resolution Times The supplier must meet the following timeframes: (1) Initial response to claims: 24 to 72 hours; and (2) Resolution of defects: 7 to 15 business days from the equipment evaluation.

d. Availability of Spare Parts The bidder must certify the availability of spare parts throughout the estimated useful life of the equipment, including a parts list and costs.

3. Required Documentation for Execution of the "Hospital and Medical Equipment" Allowance

   The Contractor shall submit: (1) A complete list of equipment with technical specifications that meet all requirements; (2) Warranty certificates; (3) Technical and maintenance manuals; (4) Spare parts inventory information; and (5) A statement regarding estimated delivery and installation times.

4. Quality Requirements and Certifications

   The Contractor shall provide evidence of: (1) Materials suitable for hospital use (stainless steel, electrostatic paint, antibacterial laminate, etc.); (2) Compliance with applicable standards (ANSI/BIFMA for chairs, structural safety standards, etc.); and (3) Compatibility with disinfectants used in hospitals.

5. Assembly and Construction Specifications

   The Contractor shall submit a narrative to ASEM describing the following for each piece of equipment: (1) Type of welding used and anti-corrosion treatment; (2) Tube dimensions, thicknesses, and materials; (3) Wheel type and resistance level; (4) Maximum load capacity per piece of equipment; and (5) Actual photographs of the offered model (not from a generic catalog).

6. Demonstration and Testing Requirements By submitting their proposal, the Contractor acknowledges and agrees that ASEM may request: (1) Functional demonstration of the equipment; (2) Physical samples before awarding the contract (if the purchase is significant); and (3) Technical inspection prior to final delivery.

7. Electrical and IT Requirements

    a. All electrical and information technology (IT) infrastructure requirements must comply with applicable codes and standards, including the National Electrical Code (NEC), NFPA 99, NFPA 70, IEEE, critical power hospital standards, and relevant local and federal regulations. Evidence of compliance may be required.
    b. The Contractor will be responsible for properly integrating and verifying all electrical and network connections necessary for the operation of the equipment. The Contractor will also be responsible for coordinating with the Engineering and IT Departments to ensure compatibility and proper operation.
    c. The supplier and contractor shall provide plans, connection diagrams and technical documentation related to the electrical and network installation.

8. Packaging and Transportation

    The Contractor shall guarantee: (1) Sturdy packaging to protect the equipment during transport; (2) Additional protection for moving or delicate parts; and (3) Transport handled by trained supplier personnel.

9. Insurance and Liability

    Prior to delivery and installation of the equipment, the Contractor must provide: (1) Proof of current liability insurance; and (2) Guarantee of coverage for property damage during delivery or installation.

10. Training and Maintenance

    The Contractor shall provide basic training to assigned personnel on the use, assembly, cleaning, and care of the equipment. In addition, the Contractor shall be responsible for developing and submitting a Preventive Maintenance Plan for each piece of equipment. This Preventive Maintenance Plan shall include: (1) List of recommendations; (2) Parts requiring periodic inspection; (3) Suggested maintenance frequency.

11. Substitution and Compliance Policies

a. ASEM reserves the right to accept or reject substitutions for products of equal or higher quality that meet the minimum specifications and descriptions established in the documents of this RFP.

b. The Contractor is responsible for providing ASEM with technical evidence of equivalence or any other information that ASEM deems necessary for its consideration.

c. Any equipment that does not fully comply with the specifications, as required by ASEM, will be rejected outright.

d. If the Contractor purchases, delivers, and installs equipment that does not meet the project specifications, the contractor shall assume all costs related to its removal, return, transportation, and replacement, without any additional expense to the client.

e. The Contractor shall be fully responsible for any impact that the installation of non-conforming equipment may have on the schedule, the quality of the project, or the operation of related systems.

f. The Contractor may not claim time extensions, additional costs, lost productivity, or any other impact associated with the removal, correction, or replacement of nonconforming equipment.

g. If the removal and replacement of nonconforming equipment cause project delays, the contractor will be subject to the delay penalties stipulated in the contract, including daily charges, loss of performance bonuses, and impact on compliance metrics.

h. ASEM may withhold payments related to the equipment, associated subcontractors, or affected activities until the compliant replacement is installed and verified.

i. Non-compliance may be documented in the Contractor's performance record, affecting future evaluations, eligibility for new contracts, or the withholding of additional work on the same project.

j. The Contractor must submit a corrective action plan to prevent recurrence, including internal controls, specification reviews, and validation processes prior to purchase and installation.

NOTAS:

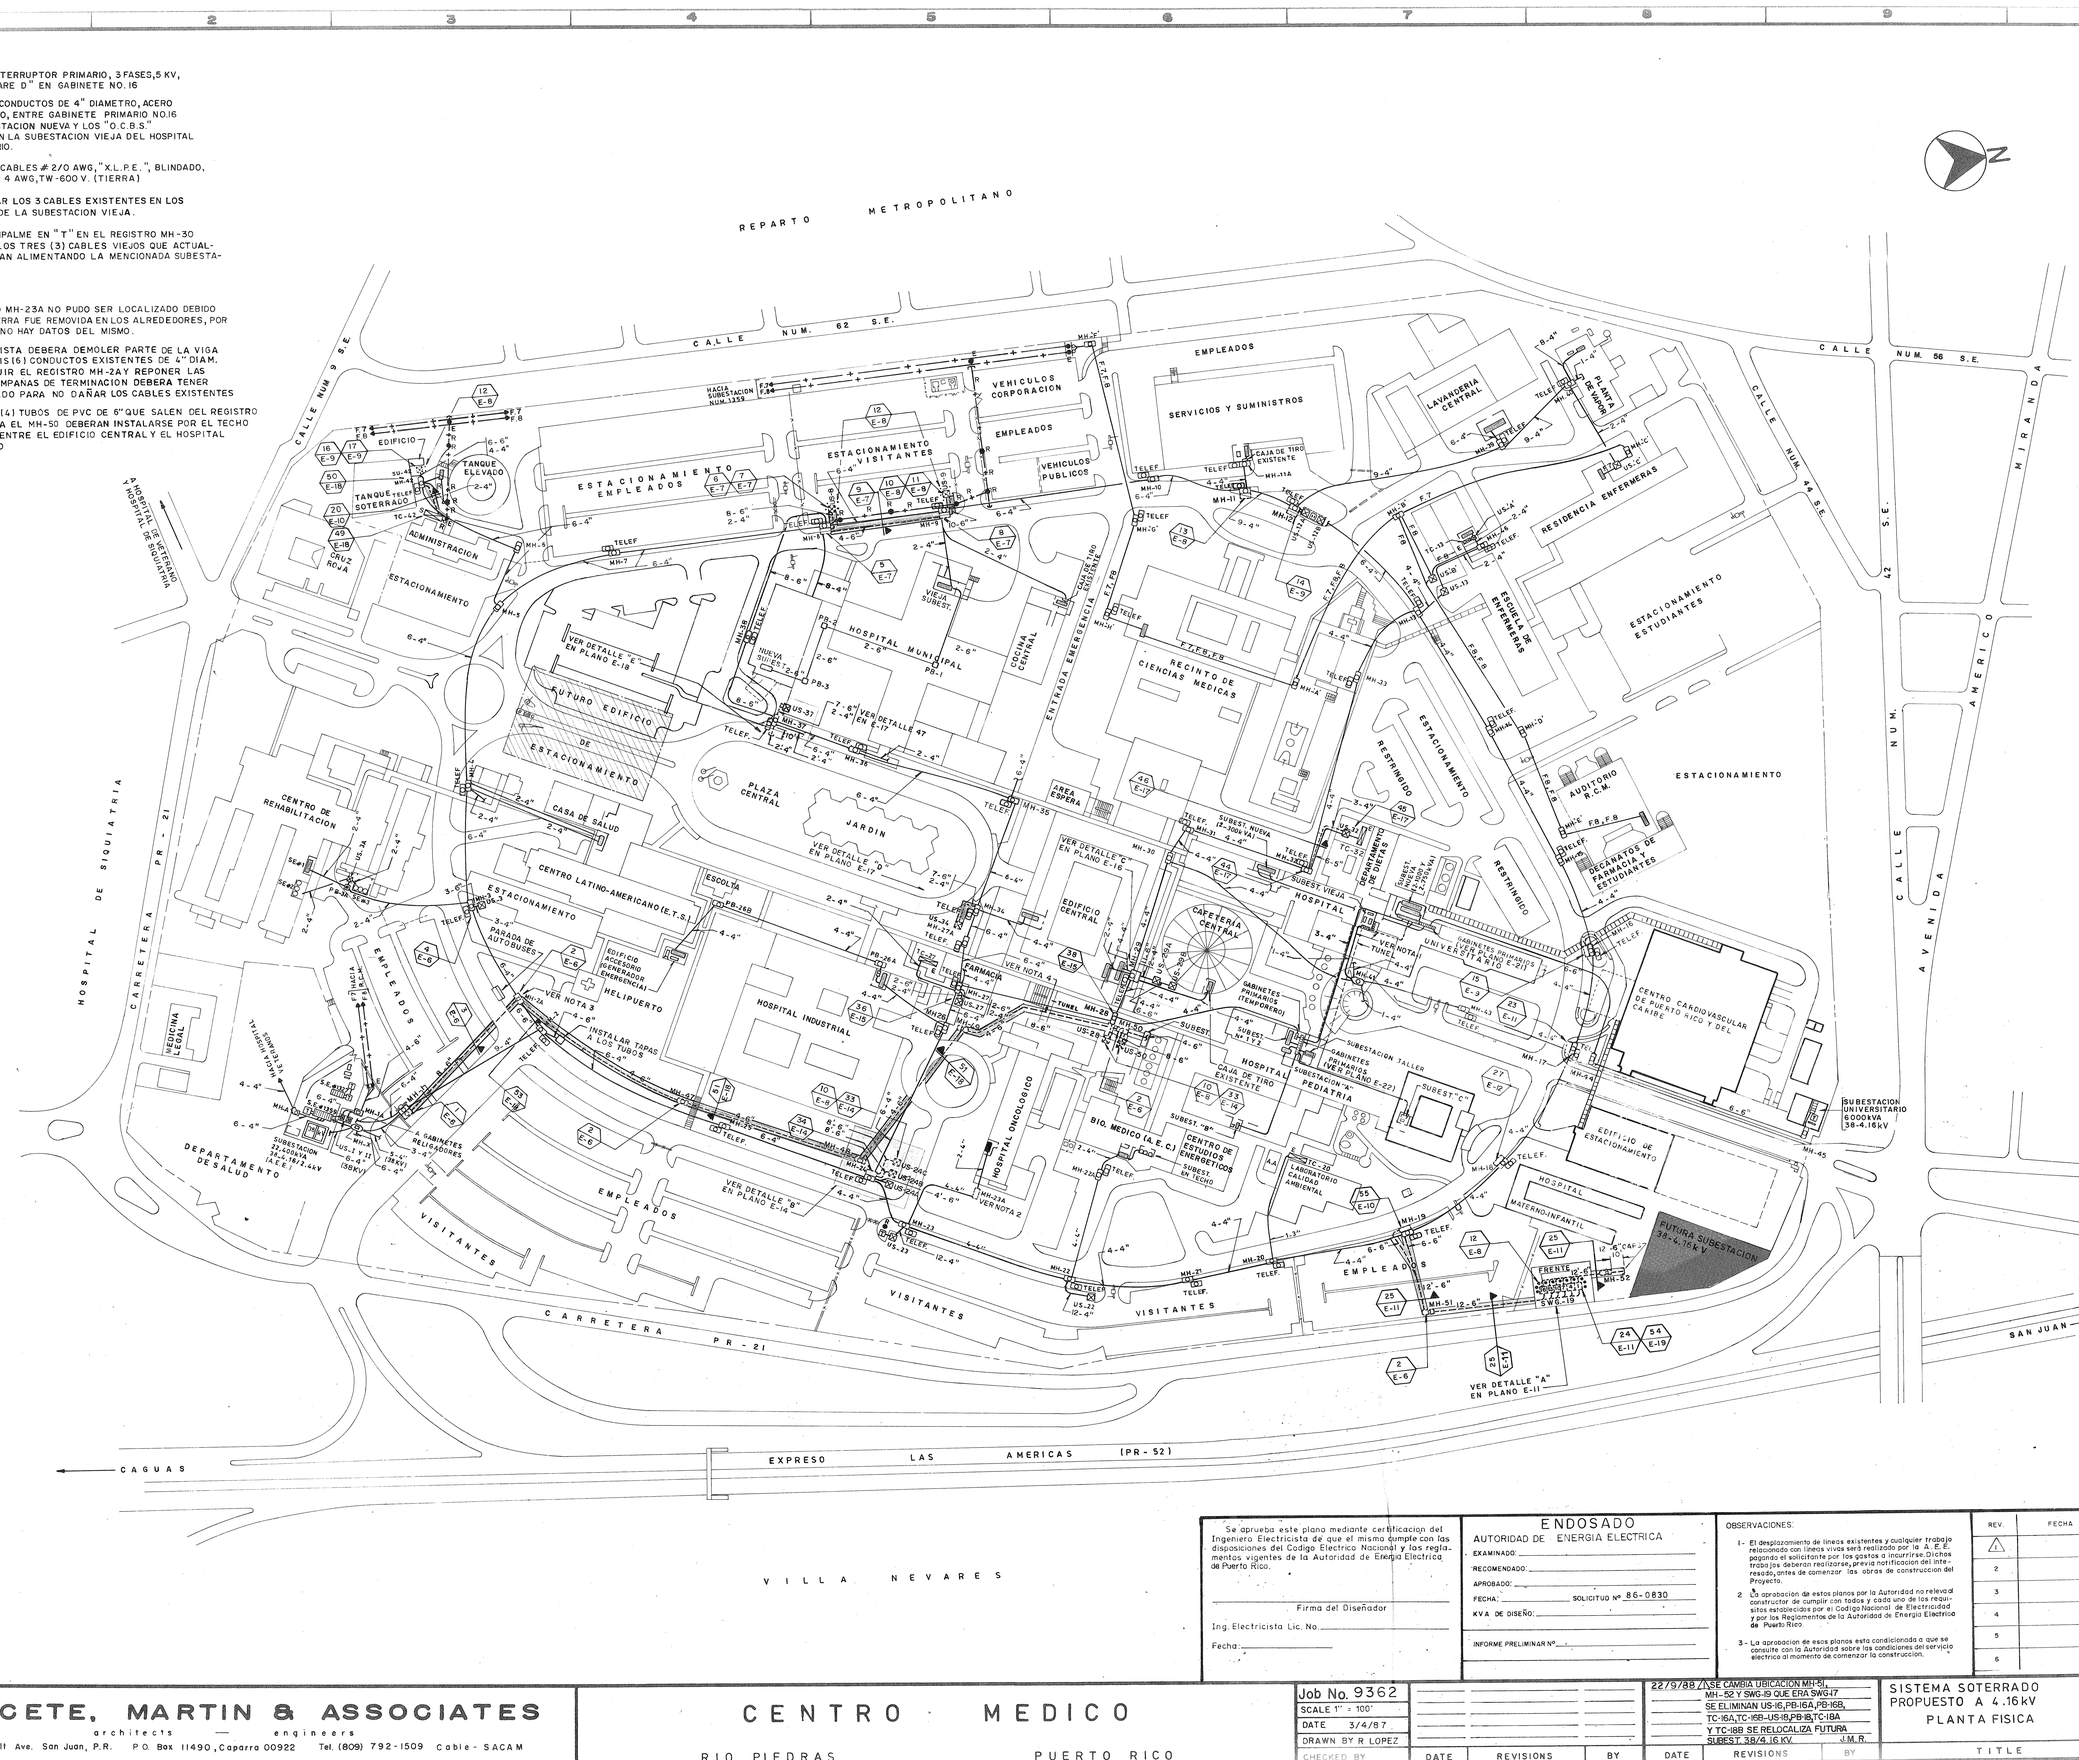
1- a) INSTALAR INTERRUPTOR PRIMARIO, 3 FASES, 5 KV, 600 A, "SQUARE D" EN GABINETE NO. 16

b) INSTALAR 2 CONDUCTOS DE 4" DIAMETRO, ACERO GALVANIZADO, ENTRE GABINETE PRIMARIO NO.16 EN LA SUBESTACION NUEVA Y LOS "O.C.B.S." PRIMARIOS EN LA SUBESTACION VIEJA DEL HOSPITAL UNIVERSITARIO.

c) INSTALAR 3 CABLES # 2/0 AWG, "X.L.P.E.", BLINDADO, 15 KV. Y 1 C # 4 AWG, TW-600 V. (TIERRA)



d) DESCONECTAR LOS 3 CABLES EXISTENTES EN LOS "O.C.B.S." DE LA SUBESTACION VIEJA.

e) ELIMINAR EMPALME EN "T" EN EL REGISTRO MH-30 Y RETIRAR LOS TRES (3) CABLES VIEJOS QUE ACTUALMENTE ESTAN ALIMENTANDO LA MENCIONADA SUBESTACION VIEJA.

2- EL REGISTRO MH-23A NO PUDO SER LOCALIZADO DEBIDO A QUE LA TIERRA FUE REMOVIDA EN LOS ALREDEDORES, POR CUYA RAZON NO HAY DATOS DEL MISMO.

3- EL CONTRATISTA DEBERA DEMOLER PARTE DE LA VIGA CON LOS SEIS(6) CONDUCTOS EXISTENTES DE 4" DIAM. AL CONSTRUIR EL REGISTRO MH-23A Y REPONER LAS DOCE(12) CAMPANAS DE TERMINACION DEBERA TENER SUMO CUIDADO PARA NO DAÑAR LOS CABLES EXISTENTES

4- LOS CUATRO(4) TUBOS DE PVC DE 6" QUE SALEN DEL REGISTRO MH-49 HACIA EL MH-50 DEBERAN INSTALARSE POR EL TECHO DEL TUNEL ENTRE EL EDIFICIO CENTRAL Y EL HOSPITAL ONCOLOGICO

Se aprueba este plano mediante certificacion del Ingeniero Electricista de que el mismo cumple con las disposiciones del Codigo Electrico Nacional y las reglamentos vigentes de la Autoridad de Energia Electrica de Puerto Rico.

GENERAL NOTES

1. CONTRACTOR TO VERIFY ALL CONDITIONS, LOCATIONS & DIMENSIONS AT SITE.
2. STREET LIGHTING CABLE TO BE LAID CLOSE TO CURBS SO AS TO AVOID TREES AND PLANTING.
3. CONTRACTOR TO CO-ORDINATE STREET LIGHTING LOCATIONS WITH TREES, PLANTING AND LANDSCAPING LOCATIONS AND DETAILS SO AS TO AVOID CONFLICTS.
4. SEE DWG. "E7" FOR SECTIONS AND DETAILS.
5. DUCTS AND CONNECTIONS SHOWN TO FUTURE BUILDINGS ARE DEPENDANT UPON FUTURE BUILDING LOCATIONS AND ITS ELECTRICAL FACILITIES LOCATIONS (WHICH SHALL BE VERIFIED BY CONTRACTOR). CONTRACTOR SHALL PROVIDE DUCTS AND CONNECTIONS TO FUTURE BUILDINGS AS REQUIRED BY THE ENGINEER.
6. PICK UP TELEPHONE SERVICE FROM PUERTO RICO TELEPHONE CO. POLE AND MANHOLES.
7. CONTRACTOR IS TO VERIFY ALL BUILDINGS AND ELECTRIC FACILITIES LOCATIONS.
8. EXACT LOCATIONS OF CONDUIT TERMINATIONS SHALL BE VERIFIED BY CONTRACTOR BY SITE INSPECTION OF EQUIPMENT LOCATIONS.
9. GROUNDING SYSTEMS AS REQUIRED BY LOCAL ELECTRICAL CODE AND P.R.W.R.A. REGULATIONS SHALL BE SUPPLIED AND INSTALLED. GROUND ALL EQUIPMENT AS SPECIFIED BY EQUIPMENT MANUFACTURERS.
10. ALL SCHEDULES ARE PREPARED FOR DESIGN CONVENIENCE. ALL QUANTITIES AND SIZES SHALL BE VERIFIED BY CONTRACTOR FROM THESE PLANS.
11. CIRCUIT NUMBERS ARE ASSIGNED FOR DESIGN CONVENIENCE. PHASE LOADINGS SHALL BE BALANCED AT EACH PANEL TO DESIGN LIMITS SET BY P.R.W.R.A.
12. INSTALL ALL CONTROL WIRING, CONDUITS AND DEVICES AS REQUIRED BY MANUFACTURERS CONTROL WIRING REQUIREMENTS FOR INDIVIDUAL EQUIPMENT, MOTORS AND CONTROL PANELS.
13. ALL OUTDOOR CONDUITS AND EQUIPMENT TO BE WATER TIGHT. SLEEVES WHERE NECESSARY.
14. ALL EXPOSED CONDUIT SHALL BE FLAT, SNUG TO MOUNTING SURFACE AND PARALLEL TO WALLS.
15. CONTRACTOR TO REMOVE ALL EXISTING ABOVE GROUND ELECTRICAL FACILITIES AND EQUIPMENT AND ABANDON ALL EXISTING UNDERGROUND ELECTRICAL FACILITIES AND CAP ALL LIVE ENDS THROUGHOUT SITE AS WORK PROGRESS OBSOLETES SAID ELECTRICAL FACILITIES AND EQUIPMENT. ALL REMOVALS AND ABANDONMENTS SHALL BE DONE AS DIRECTED BY THE ENGINEERS.
16. CONTRACTOR TO CO-ORDINATE WITH ALL TRADES AND VERIFY AND CO-ORDINATE WITH ALL WORK UNDER ALL OTHER SECTIONS OF THE SPECIFICATIONS. DO NOT CONFLICT WITH STEAM, WATER, GAS, OXYGEN, SOIL, ETC. LINES. WHERE NECESSARY ADJUST ELECTRIC WORK LOCATIONS AND ELEVATIONS AS DIRECTED AND APPROVED BY THE ENGINEER.

GENERAL NOTES:

1. 10" WATER MAIN LOOP SHALL BE INSTALLED 5'-0" FROM EDGE OF ROAD OR CURB.
2. GAS MAINS SHALL BE INSTALLED IN SAME TRENCH 1'-6" FROM WATER MAINS OR 6'-6" FROM CURB.
3. ALL FIRE HYDRANTS SHALL HAVE UNDERWRITERS APPROVED SHUT OFF VALVE BETWEEN HYDRANT & MAIN.
4. ALL SERVICES TO FUTURE OR NEWLY CONSTRUCTED BUILDINGS SHALL TERMINATE AT BUILDING CONTRACT LIMIT LINES UNLESS OTHERWISE NOTED.
5. FIRE HYDRANTS (HYD) TO BE LOCATED AT CURB AS APPROVED, INSTALLED EVERY 500 FT. MIN. AND/OR, AS APPROVED BY PROPER AUTHORITIES HAVING JURISDICTION. CONTRACTOR TO INSTALL AN ADJUSTED QUANTITY OTHER THEN SHOWN ON PLANS AS DETERMINED BY SAME AUTHORITIES. CONTRACTOR IS ALSO CAUTIONED TO INSTALL PROPER HYDRANTS AT BLDGS. NOT SHOWN ON PLANS.
6. CONTRACTOR TO REMAIN RESPONSIBLE & REVISE (UNDER AUTHORIZED SUPERVISION) ANY NEW OR EXISTING MANHOLE OR ANY PIPING FOUND ON JOB NOT SHOWN OR NOTED ON THESE DRAWINGS, DUE TO UNKNOWN CONDITIONS AT THIS TIME - WITH NO EXTRA TO OWNER.
7. ALL UNDERGROUND WATER PIPING, VALVES, CONSTRUCTION DETAILS AND INSULATION, SHALL MEET THE STANDARDS AND REQUIREMENTS OF THE PUERTO RICO AQUEDUCT AND SEWER AUTHORITY.
